Page 2 of 2 August 2024

#### **BACKGROUND**

A monthly reporting packet is provided to keep all members apprised of Watermaster revenues, expenditures, and other financial activity. Monthly reports include the following:

- 1. Cash Disbursements Summarized report of all payments made during the reporting month.
- 2. Credit Card Expense Detail Detail report of all credit card activity during the reporting month.
- 3. Combining Schedule of Revenues, Expenses & Changes in Net Assets Detail report of all revenue and expense activity for the fiscal YTD, summarized by pool category.
- 4. Treasurer's Report Summary of Watermaster investments holdings and anticipated earnings as of month end.
- 5. Budget to Actual Report Detail report of actual revenue and expense activity, shown for reporting month and YTD, comparatively to the adopted budget.
- Monthly Variance Report & Supplemental Schedules Supporting schedule providing explanation for major budget variances. Also provides several additional tables detailing pool fund balance, salaries expense, legal expense, and engineering expense.

#### DISCUSSION

Detailed explanation of major variances and other additional information can be found on the "Monthly Variance Report & Supplemental Schedules."

Watermaster staff is happy to provide additional explanation or respond to any questions on these reports.

#### **ATTACHMENTS**

- 1. Monthly Financial Reports (May 31, 2024)
- 2. Monthly Financial Reports (June 30, 2024)

## Chino Basin Watermaster

Monthly Variance Report & Supplemental Schedules For the period July 1, 2023 to May 31, 2024 (Unaudited)

## **Budget to Actual**

The Budget to Actual report summarizes the operating and non-operating revenues and expenses of Chino Basin Watermaster for the fiscal year-to-date (YTD). Columns are included for current monthly and YTD activity shown comparatively to the FY 24 adopted budget. The final two columns indicate the amount over or under budget, and the YTD percentage of total budget used. As of May 31<sup>st</sup>, the target budget percentage is generally 92%.

#### Revenues

**Lines 1-5 Administration Revenue** – Includes local agency subsidies and administrative assessment for the Appropriative, Agricultural and Non-Agricultural Pools. Below is a summary of notable account variances at month end:

- Line 2 Local Agency Subsidies is at 100% of budget due to annual administrative assessment received from Metropolitan Water District.
- Lines 3-4 Administrative Assessments for the Agricultural and Non-Agricultural Pools include annual assessment
  invoices issued in November of each year, as well as special assessments issued at the direction of the respective
  Pools. The Appropriative Pool line is over budget due to changes in actual versus projected production, and special
  assessments issued.

**Lines 6-12 Other Revenue** – Includes Pool replenishment assessments, interest income, miscellaneous income, and carryover budget from prior years.

### **Expenses**

**Lines 14-35 Judgment Administration Expense** – Includes Watermaster general administrative expenses, contract services, insurance, office and other administrative expenses. Below is a summary of notable account variances at month end:

- Line 16 Admin Salary/Benefit Costs includes wages and benefits for Watermaster administrative staff. YTD is over budget due to vacation, sick time, and severance payouts.
- Line 21 Contract Services includes outside services for the annual audit report, HR consulting, court filings, and accounting consulting. YTD is over budget due to increased consulting services not anticipated in the budget. These increased consulting service costs should be offset by savings in administrative salaries and benefits.
- Line 24 Dues and Subscriptions is at 96% of budget due to the timing of annual dues for ACWA, SHRM, and CA Groundwater Coalition.
- Line 25 Watermaster Administrative Expenses include meeting expenses and supplies for admin, committee, and other meetings. YTD is at 98% due to increased meeting activity.

**Lines 36-47 Optimum Basin Management Plan (OBMP) Expense** – Includes legal, engineering, groundwater level monitoring, allocated administrative expenses, and other expenses.

**Lines 48-54 Pool Administration Expenses** – Includes expense activity relating to Pool specific fund balances. These include legal services for each Pool, Ag Pool meeting compensation, and Ag Pool special projects.

**Lines 56-59 Other Expense** – Includes groundwater replenishment, and various refunds as appropriate. YTD activity includes refunds for prior year recharge basin O&M expenses and excess reserves.

Monthly Variance Report & Supplemental Schedules For the period July 1, 2023 to May 31, 2024 (Unaudited)

## **Pool Services Fund Accounting**

Each Pool has a fund account created to pay their own legal service invoices. The legal services invoices are funded and paid using the fund accounts (8467 for the Overlying Agricultural Pool (OAP), 8567 for the Overlying Non-Agricultural Pool (ONAP), and 8367 for the Appropriate Pool (AP)). Along with the legal services fund account for the OAP (8467), the OAP also has two other fund accounts for Ag Pool Meeting Attendance expenses (8470), and Special Projects expenses (8471). The ONAP also has a meeting compensation fund account (8511). Additionally, the OAP has a reserve fund that is held by Watermaster and spent at the direction of the OAP. The AP also has account 8368 relating to the Tom Harder contract. These fund accounts are replenished at the direction of each Pool, and the legal service invoices are approved by the Pool leadership and when paid by Watermaster, are deducted from the existing fund account balances. If the fund account for any pool reaches zero, no further payments can be paid from the fund and a replenishment action must be initiated by the Pool.

The following tables detail the fund balance accounts as of May 31, 2024 (continued next page):

Monthly Variance Report & Supplemental Schedules For the period July 1, 2023 to June 30, 2024 (Unaudited)

## **Budget to Actual**

The Budget to Actual report summarizes the operating and non-operating revenues and expenses of Chino Basin Watermaster for the fiscal year-to-date (YTD). Columns are included for current monthly and YTD activity shown comparatively to the FY 24 adopted budget. The final two columns indicate the amount over or under budget, and the YTD percentage of total budget used.

#### Revenues

**Lines 1-5 Administration Revenue** – Includes local agency subsidies and administrative assessment for the Appropriative, Agricultural and Non-Agricultural Pools. Below is a summary of notable account variances at month end:

Lines 3-4 Administrative Assessments for the Agricultural and Non-Agricultural Pools include annual assessment
invoices issued in November of each year, as well as special assessments issued at the direction of the respective
Pools. The Appropriative Pool line ended over budget due to changes in actual versus projected production, and
special assessments issued.

**Lines 6-12 Other Revenue** – Includes Pool replenishment assessments, interest income, miscellaneous income, and carryover budget from prior years.

### **Expenses**

**Lines 14-35 Judgment Administration Expense** – Includes Watermaster general administrative expenses, contract services, insurance, office and other administrative expenses. Below is a summary of notable account variances at month end:

- Line 16 Admin Salary/Benefit Costs includes wages and benefits for Watermaster administrative staff. The account ended over budget due to vacation, sick time, and severance payouts.
- Line 21 Contract Services includes outside services for the annual audit report, HR consulting, court filings, and
  accounting consulting. The account ended over budget due to increased consulting services not anticipated in the
  budget. These increased consulting service costs should be offset by savings in administrative salaries and
  benefits.

**Lines 36-47 Optimum Basin Management Plan (OBMP) Expense** – Includes legal, engineering, groundwater level monitoring, allocated administrative expenses, and other expenses.

**Lines 48-54 Pool Administration Expenses** – Includes expense activity relating to Pool specific fund balances. These include legal services for each Pool, Ag Pool meeting compensation, and Ag Pool special projects.

**Lines 56-59 Other Expense** – Includes groundwater replenishment, and various refunds as appropriate. YTD activity includes refunds for prior year recharge basin O&M expenses and excess reserves.

Monthly Variance Report & Supplemental Schedules For the period July 1, 2023 to June 30, 2024 (Unaudited)

## **Pool Services Fund Accounting**

Each Pool has a fund account created to pay their own legal service invoices. The legal services invoices are funded and paid using the fund accounts (8467 for the Overlying Agricultural Pool (OAP), 8567 for the Overlying Non-Agricultural Pool (ONAP), and 8367 for the Appropriate Pool (AP)). Along with the legal services fund account for the OAP (8467), the OAP also has two other fund accounts for Ag Pool Meeting Attendance expenses (8470), and Special Projects expenses (8471). The ONAP also has a meeting compensation fund account (8511). Additionally, the OAP has a reserve fund that is held by Watermaster and spent at the direction of the OAP. The AP also has account 8368 relating to the Tom Harder contract. These fund accounts are replenished at the direction of each Pool, and the legal service invoices are approved by the Pool leadership and when paid by Watermaster, are deducted from the existing fund account balances. If the fund account for any pool reaches zero, no further payments can be paid from the fund and a replenishment action must be initiated by the Pool.

The following tables detail the fund balance accounts as of June 30, 2024 (continued next page):

	_				
Fund Balance For Non-Agricultural Pool Account 8567 - Legal Services			Fund Balance For Appropriative Pool Account 8367 - Legal Services

## Monthly Variance Report & Supplemental Schedules For the period July 1, 2023 to June 30, 2024 (Unaudited)

## Engineering

The following table details the Year-To-Date (YTD) Actual Engineering costs compared to the FY 24 adopted budget. The "\$ Over Budget" and the "% of Budget" columns are a comparison of the YTD actual to the annual budget.

Segmenting Services Costs   Services   Ser		Year to Date Actual	FY 23-24 Budget	\$ Over / (Under) Budget	% of Budget

#### STAFF REPORT

DATE: August 15, 2024

TO: Advisory Committee Members

SUBJECT: Application: Water Transaction - West Valley Water District to Niagara Bottling, LLC

(Consent Calendar Item I.C.)

#### SUMMARY:

<u>Issue</u>: The Purchase of 2,000 acre-feet of water from West Valley Water District by Niagara Bottling, LLC. This purchase is made from West Valley Water District's Local Excess Carry Over Storage Account. [Within WM Duties and Powers]

<u>Recommendation:</u> Provide advice and assistance to the Watermaster Board on the proposed transaction.

Financial Impact: None.

#### **Future Consideration**

Advisory Committee – August 15, 2024: Advice and assistance. Watermaster Board – August 22, 2024: Approval.

#### ACTIONS:

Appropriative Pool – June 13, 2024: Unanimously recommended Advisory Committee to recommend Watermaster Board approval.

Non-Agricultural Pool – June 13, 2024: Unanimously recommended its representatives to support at Advisory Committee and Watermaster Board subject to changes they deem appropriate.

Agricultural Pool - June 13, 2024: Unanimously recommended Advisory Committee to recommend Watermaster Board approval.

Watermaster's function is to administer and enforce provisions of the Judgment and subsequent orders of the Court, and to develop and implement an Optimum Basin Management Program

Page 2 of 2

#### **BACKGROUND**

On July 13, 2000, the Court approved the Peace Agreement, the Implementation Plan (OBMP), and the goals and objectives identified in the OBMP Phase I Report and ordered Watermaster to proceed in a manner consistent with the Peace Agreement. Under the Peace Agreement, Watermaster approval is required for applications to store, recapture, recharge, or transfer water, as well as for applications for credits or reimbursements, and storage and recovery programs.

Per Peace Agreement Section 5.3 (Transfers), Watermaster has the responsibility to ensure all water transfers are consistent with the Peace Agreement, OBMP and the law. Watermaster also must determine whether the transfer will cause "any Material Physical Injury to any party to the Judgment or the Basin," Provided all criteria are met, Watermaster must approve the transaction. Where the request for Watermaster approval is submitted by a Party to the Judgment, there is a rebuttable presumption that most of the transactions do not result in material physical injury to a Party to the Judgment or the Basin (Storage and Recovery Programs do not have this presumption).

The date of this application is May 6, 2024. Notice of the transaction along with the materials submitted by the requestors was transmitted to stakeholders electronically on June 7, 2024.

#### DISCUSSION

Beyond confirmation of the source of the water to be transferred (Supplemental Water or Excess Carryover), Watermaster will evaluate the eventual disposition of the transferred water (e.g., production, storage, etc.) at the end of the production year and account for the same consistent with the Watermaster Guidance Documents.

Water transactions occur each year and are included as production by the respective entity (if produced) in any relevant analysis conducted by West Yost pursuant to the Peace Agreement and the Rules & Regulations. There is no indication that additional analysis regarding this transaction is necessary at this time. As part of the OBMP Implementation Plan, measurement of groundwater levels and ground level changes are ongoing, and based on current data, we cannot conclude that the proposed water transaction will cause material physical injury to a Party to the Judgment, or to the Basin.

Pursuant to the Rules & Regulations, "The Application shall not be considered by the Advisory Committee until at least twenty-one (21) days after the last of the three Pool Committee meetings to consider the matter." While this transaction will not be presented to the Advisory Committee and Watermaster Board until August 2024 for approval since Watermaster was dark in July 2024, once approved, will count toward the current production year (2023/24).

At the Pool Committee meetings held on June 13, 2024, the Appropriative and Overlying (Agricultural) Pools unanimously recommended Advisory Committee to recommend to the Watermaster Board to approve the proposed transaction; the Overlying (Non-Agricultural) Pool unanimously recommended its representatives to support at Advisory Committee and Watermaster Board subject to changes they deem appropriate.

# TRANSFER OF WATER

Date of Notice:

June 7, 2024

This notice is to advise interested persons that the attached application(s) will come before the Watermaster Board on or after 30 days from the date of this notice.

## APPLICATION FOR TRANSFER OF WATER

The attached staff report will be included in the meeting package at the time the transfer begins the Watermaster process.

#### NOTICE OF APPLICATION(S) RECEIVED

Date of Application: May 06, 2024 Date of this notice: June 07, 2024

Please take notice that the following Application has been received by Watermaster:

• Notice of Sale or Transfer – The purchase of 2,000 acre-feet of water from West Valley Water District by Niagara Bottling, LLC. This purchase is made from West Valley Water District's Local Excess Carry Over Storage Account.

This Application will first be considered by each of the respective pool committees on the following dates:

> Appropriative Pool: June 13, 2024

> Non-Agricultural Pool: June 13, 2024

> Agricultural Pool: June 13, 2024

This **Application** will be scheduled for consideration by the Advisory Committee **no** earlier than thirty days from the date of this notice and a minimum of twenty-one calendar days after the last pool committee reviews it.

After consideration by the Advisory Committee, the *Application* will be considered by the Board.

Unless the Application is amended, as Contests must be submitted a minimum of fourteen (14) days prior to the Advisory Committee's consideration of an Application, parties to the Judgment may file Contests to the Application with Watermaster within seven calendar days of when the last pool committee considers it. Any Contest must be in writing and state the basis of the *Contest*.

#### SAID TRANSFER SHALL BE CONDITIONED UPON:

- (1) Transferee shall exercise said right on behalf of Transferor under the terms of the Judgment, the Peace Agreement, the Peace II Agreement, and the Management Zone 1 Subsidence Management Plan for the period described above. The first water produced in any year shall be that produced pursuant to carry-over rights defined in the Judgment. After production of its carry-over rights, if any, the next (or first if no carry-over rights) water produced by Transferee from the Chino Basin shall be that produced hereunder.
- (2) Transferee shall put all waters utilized pursuant to said Transfer to reasonable beneficial use.
- (3) Transferee shall pay all Watermaster assessments on account of the water production hereby Transferred.

(4) Any Transferee not already a party must Intervene a	and become a party to the Judgment.

# TRANSFER OF WATER

Date of Notice:

June 7, 2024

This notice is to advise interested persons that the attached application(s) will come before the Watermaster Board on or after 30 days from the date of this notice.

## APPLICATION FOR TRANSFER OF WATER

The attached staff report will be included in the meeting package at the time the transfer begins the Watermaster process.

#### NOTICE OF APPLICATION(S) RECEIVED

Date of Application: May 15, 2024 Date of this notice: June 07, 2024

Please take notice that the following Application has been received by Watermaster:

 Notice of Sale or Transfer – The purchase of 7,500 acre-feet of water from Cucamonga Valley Water District by Fontana Water Company. This purchase is made from Cucamonga Valley Water District's Annual Production Right.

This *Application* will first be considered by each of the respective pool committees on the following dates:

Appropriative Pool: June 13, 2024

Non-Agricultural Pool: June 13, 2024

Agricultural Pool: June 13, 2024

This *Application* will be scheduled for consideration by the Advisory Committee *no* earlier than thirty days from the date of this notice and a minimum of twenty-one calendar days after the last pool committee reviews it.

After consideration by the Advisory Committee, the *Application* will be considered by the Board.

Unless the *Application* is amended, as *Contests* must be submitted a minimum of fourteen (14) days prior to the Advisory Committee's consideration of an *Application*, parties to the Judgment may file *Contests* to the *Application* with Watermaster *within* seven calendar days of when the last pool committee considers it. Any *Contest* must be in writing and state the basis of the *Contest*.

TODD M. CORBIN General Manager

#### STAFF REPORT

DATE: August 15, 2024

TO: Advisory Committee Members

SUBJECT: Application: Water Transaction - Nicholson Family Trust to Fontana Water Company

(Consent Calendar Item I.E.)

#### SUMMARY:

<u>Issue</u>: The Purchase of 3.5 acre-feet of water from Nicholson Family Trust by Fontana Water Company. This purchase is made from Nicholson Family Trust's Annual Production Right/Operating Safe Yield first, then any additional from Storage. [Within WM Duties and Powers]

<u>Recommendation:</u> Provide advice and assistance to the Watermaster Board on the proposed transaction.

Financial Impact: None.

#### **Future Consideration**

Advisory Committee – August 15, 2024: Advice and assistance. Watermaster Board – August 22, 2024: Approval.

#### ACTIONS:

Appropriative Pool – June 13, 2024: Unanimously recommended Advisory Committee to recommend Watermaster Board approval.

Non-Agricultural Pool – June 13, 2024: Unanimously recommended its representatives to support at Advisory Committee and Watermaster Board subject to changes they deem appropriate.

Agricultural Pool - June 13, 2024: Unanimously recommended Advisory Committee to recommend Watermaster Board approval.

Watermaster's function is to administer and enforce provisions of the Judgment and subsequent orders of the Court, and to develop and implement an Optimum Basin Management Program

Page 2 of 2

#### **BACKGROUND**

On July 13, 2000, the Court approved the Peace Agreement, the Implementation Plan (OBMP), and the goals and objectives identified in the OBMP Phase I Report and ordered Watermaster to proceed in a manner consistent with the Peace Agreement. Under the Peace Agreement, Watermaster approval is required for applications to store, recapture, recharge, or transfer water, as well as for applications for credits or reimbursements, and storage and recovery programs.

Per Peace Agreement Section 5.3 (Transfers), Watermaster has the responsibility to ensure all water transfers are consistent with the Peace Agreement, OBMP and the law. Watermaster also must determine whether the transfer will cause "any Material Physical Injury to any party to the Judgment or the Basin," Provided all criteria are met, Watermaster must approve the transaction. Where the request for Watermaster approval is submitted by a Party to the Judgment, there is a rebuttable presumption that most of the transactions do not result in material physical injury to a Party to the Judgment or the Basin (Storage and Recovery Programs do not have this presumption).

The date of this application is May 27, 2024. Notice of the transaction along with the materials submitted by the requestors was transmitted to stakeholders electronically on June 7, 2024.

#### DISCUSSION

Beyond confirmation of the source of the water to be transferred (Supplemental Water or Excess Carryover), Watermaster will evaluate the eventual disposition of the transferred water (e.g., production, storage, etc.) at the end of the production year and account for the same consistent with the Watermaster Guidance Documents.

Water transactions occur each year and are included as production by the respective entity (if produced) in any relevant analysis conducted by West Yost pursuant to the Peace Agreement and the Rules & Regulations. There is no indication that additional analysis regarding this transaction is necessary at this time. As part of the OBMP Implementation Plan, measurement of groundwater levels and ground level changes are ongoing, and based on current data, we cannot conclude that the proposed water transaction will cause material physical injury to a Party to the Judgment, or to the Basin.

Pursuant to the Rules & Regulations, "The Application shall not be considered by the Advisory Committee until at least twenty-one (21) days after the last of the three Pool Committee meetings to consider the matter." While this transaction will not be presented to the Advisory Committee and Watermaster Board until August 2024 for approval since Watermaster was dark in July 2024, once approved, will count toward the current production year (2023/24).

At the Pool Committee meetings held on June 13, 2024, the Appropriative and Overlying (Agricultural) Pools unanimously recommended Advisory Committee to recommend to the Watermaster Board to approve the proposed transaction; the Overlying (Non-Agricultural) Pool unanimously recommended its representatives to support at Advisory Committee and Watermaster Board subject to changes they deem appropriate.

TODD M. CORBIN General Manager

#### STAFF REPORT

DATE: August 15, 2024

TO: Advisory Committee Members

SUBJECT: 2022 Safe Yield Methodology (Business Item II.A.)

SUMMARY:

<u>Issue</u>: The 2022 Safe Yield Methodology Memo is attached as information to the parties [Within WM Duties and Powers] [ Pages 17-18 of the 2017 Safe Yield Court Order, Section 6.5(f) of the 2022 R&R, and the 2022 Safe Yield Reset methodology]

Recommendation: Information Only

Financial Impact: None

#### Consideration

Appropriative Pool – August 8, 2024: Information Only Non-Agricultural Pool – August 8, 2024: Information Only Agricultural Pool – August 8, 2024: Information Only Advisory Committee – August 15, 2024: Information Only Watermaster Board – August 22, 2024: Information Only

#### **BACKGROUND**

On April 28, 2017, the Court issued an order to reset the Safe Yield of the Basin. The order also contained instructions as to how and when the Safe Yield should be recalculated in subsequent years. This court order set the methodology followed by the Watermaster to recalculate the Safe Yield in 2020.

After the 2020 Safe Yield Reset and a collaborative effort to evaluate the methodology, with advice from the Chino Basin parties, Watermaster moved to request a change to the methodology that the Court ordered in December of 2022.

#### DISCUSSION

Watermaster is bringing forward the Attachment A to the December 19, 2022 court order (Attachment 1), that details the methodology ordered by the Court to be followed for the Safe Yield Reset and the 2025 Safe Yield Reevaluation. This methodology has been communicated to parties by Watermaster consultant, West Yost, during the workshops conducted for the 2025 reevaluation of Safe Yield. There are many representatives from parties from all Pools who have participated in the workshops to date, but some of them may also not be a Pool member or Advisory Committee representative.

The purpose of this information item is to examine the language in the methodology and gain a general functional understanding of what efforts are being made to comply with its requirements. Since this is the first time this updated methodology is being implemented, it is important for all parties to understand how the requirements have been understood and translated into the technical work for the reevaluation of safe yield.

Safe Yield is the foundation of the Chino Basin Judgment and a key function of Watermaster's responsibilities to reevaluate it as directed. As new elements to the methodology have been added over time (long-term hydrology, changing cultural conditions, assumptions for production and recharge patterns and now uncertainty analysis, it is important for Watermaster to communicate clearly what rules are being followed and how they are being implemented. There has been a great deal of work and collaboration which has already taken place in meetings and workshops. This effort is to make sure all parties understand where we are in the process and provide an opportunity to discuss those areas where questions remain.

The item was presented to the three Pool Committees for information only.

#### RESET TECHNICAL MEMORANDUM

DATE:

October 6, 2022

Project No.: 941-80-22-32

TO:

Peter Kavounas, Chino Basin Watermaster

FROM:

Garrett Rapp, PE, RCE #86007

Andy Malone, PG

SUBJECT:

2022 Methodology to Reset the Safe Yield of the Chino Basin

#### 2022 UPDATED SAFE YIELD RESET METHODOLOGY

This technical memorandum summarizes the methodology<sup>1</sup> to calculate the Safe Yield of the Chino Basin for the 2025 Safe Yield Reevaluation and subsequent Safe Yield evaluations. The methodology: (i) is consistent with professional custom, standard, and practice; (ii) incorporates current best management practices and hydrologic science; and (iii) is consistent with the definition of Safe Yield in the Judgment and the Physical Solution.

- 1. Use data collected since the implementation of the OBMP to re-calibrate the Watermaster's groundwater-flow model. The re-calibration period should be long enough to include wet and dry periods relative to the long-term historical precipitation record.
- 2. Conduct an uncertainty analysis of the re-calibrated groundwater-flow model to identify a plausible range of calibrated models.
- 3. Describe current and projected future cultural conditions, including but not limited to land use and water-management practices, such as: pumping, managed recharge, managed groundwater storage, impervious land cover, water recycling, and water conservation practices. Identify a possible range of projected future cultural conditions.
- 4. Using the most current research on future climate and hydrology, identify a possible range of projected future climatic conditions in the Santa Ana River watershed.
- 5. Using the results of [3.] and [4.] above, prepare an ensemble of multiple projection scenarios of combinations of future climate/hydrology and cultural conditions (herein called the "Projection Ensemble"). Assign likelihoods to each scenario in the Projection Ensemble.
- 6. Simulate the range for the potential future water budget and groundwater conditions in the Chino Basin over no less than a 50-year future period. This is accomplished by using:
  - i. The range of calibrated models developed in [2.], and
  - ii. The Projection Ensemble developed in [5.] as model input data.

<sup>&</sup>lt;sup>1</sup> A detailed description of the methodology summarized here can be found in the technical memorandum titled "2022 Update of the Chino Basin Safe Yield Reset Methodology," dated October 6, 2022.

TM – Chino Basin Watermaster October 6, 2022 Page 2

- 7. Using the results of [6.] above, characterize the range in the model results for:
  - Groundwater conditions, including: groundwater elevations, groundwater in storage, and groundwater flow directions, and
  - ii. The water budget, including: basin inflows, outflows, change in storage, and net recharge.
- 8. Using the set of net recharge results from [7.ii], determine a tentative Safe Yield as the likelihood-weighted average net recharge over the 10-year prospective period for which the Safe Yield is being redetermined (Tentative Safe Yield).
- 9. Evaluate whether the groundwater production at the Tentative Safe Yield estimated in [8] above will cause or threaten to cause "undesirable results" or "Material Physical Injury." If groundwater production at Tentative Safe Yield will cause or threaten to cause "undesirable results" or "Material Physical Injury," then Watermaster will identify and implement prudent measures necessary to mitigate "undesirable results" or "Material Physical Injury," set the value of Safe Yield to ensure there is no "undesirable results" or "Material Physical Injury," or implement a combination of mitigation measures and a changed Safe Yield.

# CHAPTER 1 Background and Objectives

This third annual report on *Data Collection and Evaluation – Fiscal Year 2022/2023* describes and documents the required data collection and evaluation pursuant to the April 28, 2017 Court Order on the Safe Yield of the Chino Basin (2017 Court Order). This chapter describes background information on the Court requirements to prepare this annual report, the scope of work of this effort, the report objectives, and the organization of this report.

#### 1.1 2017 COURT ORDER REQUIREMENTS

The 2017 Court Order that set the Safe Yield at 135,000 acre-feet per year (afy) for the period fiscal year (FY) 2011 through 2020<sup>2</sup> also included requirements to guide future model updates and Safe Yield recalculations (SYR) and resets. These requirements, which were later affirmed by the Court in March 2019,<sup>3</sup> are listed below verbatim from pages 15 through 17 of the 2017 Court Order:

- 4.3 Interim Correction. In addition to the scheduled reset [of the Safe Yield effective July 1, 2020 that will continue until June 30, 2030], the Safe Yield may be reset in the event that, with the recommendation and advice of the Pools and Advisory Committee and in the exercise of prudent management discretion described in Paragraph 4.5(c), below, Watermaster recommends to the court that the Safe Yield must be changed by an amount greater (more or less) than 2.5 percent of the then-effective Safe Yield.
- 4.4 Safe Yield Reset Methodology. The Safe Yield has been reset effective July 1, 2010, and shall be subsequently evaluated pursuant to the methodology set forth in the Reset Technical Memorandum [(WEI, 2015)<sup>4</sup>]. The reset will rely upon long-term hydrology and will include data from 1921 to the date of the reset evaluation. The long-term hydrology will be continuously expanded to account for new data from each year, through July 2030, as it becomes available. This methodology will thereby account for short-term climatic variations, wet and dry. Based on the best information practicably available to the Watermaster, the Reset Technical Memorandum sets forth a prudent and reasonable professional methodology to evaluate the then prevailing Safe Yield in a manner consistent with the Judgement, the Peace Agreements, and the OBMP Implementation Plan. In furtherance of the goal of maximizing the beneficial use of the waters of the Chino Basin, Watermaster, with the recommendation and advice of the Pools and Advisory Committee, may supplement the Reset Technical Memorandum's methodology to incorporate future advances in best management practices and hydrologic science as they evolve over the term of this order.

<sup>&</sup>lt;sup>1</sup> Orders for Watermaster's Motion Regarding the 2015 Safe Yield Reset Agreement, Amendment of Restated Judgment, Paragraph 6, Superior Court for the County of San Bernardino (2017).

<sup>&</sup>lt;sup>2</sup> On July 10, 2020, the Court updated the Safe Yield to 131,000 afy for the period FY 2021 to 2030. *Order re Chino Basin Watermaster Motion Regarding 2020 Safe Yield Reset, Amendment of Restated Judgment, Paragraph 6*, Superior Court for the County of San Bernardino (2020).

<sup>&</sup>lt;sup>3</sup> Order Regarding the Appeal Parties Motion, Superior Court for the County of San Bernardino (2019).

<sup>&</sup>lt;sup>4</sup> WEI. (2015). Methodology to Reset Safe Yield Using Long-Term Average Hydrology and Current and Projected Future Cultural Conditions. Prepared for the Chino Basin Watermaster, August 2015.

#### **Background and Objectives**

- 4.5 Annual Data Collection and Evaluation. In support of its obligations to undertake the
  reset in accordance with the Reset Technical Memorandum and this order, Watermaster
  shall annually undertake the following actions:
  - (a) Ensure that, unless a Party to the Judgment is excluded from reporting, all production by all Parties to the Judgment is metered, reported, and reflected in Watermaster's approved Assessment Packages;
  - (b) Collect data concerning cultural conditions annually with cultural conditions including, but not limited to, land use, water use practices, production, and facilities for the production, generation, storage, recharge, treatment, or transmission of water;
  - (c) Evaluate the potential need for prudent management discretion to avoid or mitigate undesirable results including, but not limited to, subsidence, water quality degradation, and unreasonable pump lifts. Where the evaluation of available data suggests that there has been or will be a material change from existing and projected conditions or threatened undesirable results, then a more significant evaluation, including modeling, as described in the Reset Technical Memorandum, will be undertaken; and,
  - (d) As part of its regular budgeting process, develop a budget for the annual data collection, data evaluation, and any scheduled modeling efforts, including the methodology for the allocation of expenses among the Parties to the Judgment. Such budget development shall be consistent with section 5.4(a) of the Peace Agreement.
- 4.6 Modeling. Watermaster shall cause the Basin Model to be updated and a model evaluation of Safe Yield, in a manner consistent with the Reset Technical Memorandum, to be initiated no later than January 1, 2024, in order to ensure that the same may be completed by June 30, 2025.
- 4.7 *Peer Review.* The Pools shall be provided with reasonable opportunity, no less frequently than annually, for peer review of the collection of data and the application of data collected in regard to the activities described in Paragraphs 4.4, 4.5, and 4.6 above.

This report addresses the requirements in "4.5 – *Annual Data Collection and Evaluation*" for the period FY 2019 through 2030.

#### 1.2 SCOPE OF THE ANNUAL DATA COLLECTION AND EVALUATION

The scope of work for the annual data collection and evaluation for FY 2024 is the following:

- **Data collection.** Watermaster will collect the following datasets pursuant to pages 16 and 17 of the 2017 Court Order:
  - Groundwater pumping
  - Water supply plans (from major Appropriative Pool parties)
  - Land use
  - Data to estimate indoor and outdoor urban water use
  - Managed groundwater recharge
  - Information on regional water infrastructure (from major Appropriative Pool parties)

#### **Chapter 1**

#### **Background and Objectives**

For each of these datasets, Watermaster will collect historical data since the last recalculation of the Safe Yield (2019-23 Actual Data) and the necessary information to prepare an updated projection of these datasets for the remaining period of the then-current Safe Yield (2024 Projection). The 2024 Projection spans the period FY 2024-2030.

- **Data evaluation.** Watermaster will compare the 2019-23 Actual Data and the 2024 Projection to the data and assumptions that were used in the projection scenario for the 2020 Safe Yield Recalculation (2020 SYR Projection), which was documented in the *2020 Safe Yield Recalculation Report* (2020 SYR Report). Specifically, the comparison includes:
  - 2020 SYR Projection for FY 2019-2023 versus 2019-23 Actual Data
  - 2020 SYR Projection versus 2024 Projection (FY 2024-2030)

These comparisons are meant to answer the two questions posed by the 2017 Court Order:

- 1) Is there a potential for undesirable results that were not identified in the 2020 SYR?

  Specifically, is there a "potential need for prudent management discretion to avoid or mitigate undesirable results including, but not limited to, subsidence, water quality degradation, and unreasonable pump lifts"? (2017 Court Order, p. 17)
- 2) Is there a reasonable likelihood that the cumulative impact of the differences between the new datasets/projections (i.e., the 2019-23 Actual Data and the 2024 Projection) and the data and assumptions in the 2020 SYR would result in the actual Safe Yield being greater than 2.5 percent (more or less) than the current Safe Yield? (2017 Court Order, p. 15-16). This question is evaluated over the period of the current Safe Yield, which is FY 2021-30.

Answers to these questions are qualitative and based on professional judgement, an understanding of the Chino Basin, and prior modeling investigations. An affirmative answer to either of the above questions "suggests that there has been or will be a material change from existing and projected conditions or threatened undesirable results," which would necessitate "a more significant evaluation." (2017 Court Order, p. 17). In this case, Watermaster will describe the scope of work and cost estimates of any further evaluations required.

- **Reporting.** Watermaster will prepare an annual report to document the data collection and evaluation process and will include recommendations for improvements to subsequent annual data collection and evaluation efforts.
- Peer review. Watermaster will provide the parties opportunity for review and comment on the collected data, the evaluations of the data, and the draft report, and will respond to written comments from the parties in an appendix to the final report.

#### 1.2.1 Nexus to 2025 Safe Yield Reevaluation and Change in Scope

If "more significant evaluation, including modeling, as described in the Reset Technical Memorandum" than this annual data collection process is required, such analysis could not practicably occur prior to the 2025 Safe Yield Reevaluation (2025 SYR), scheduled for completion by June 30, 2025, pursuant to the 2017 Court Order. The 2025 SYR involves updating the CVM to include more recent historical data, recalibrating the CVM through FY 2022, completing an uncertainty analysis, and simulating multiple projection

\_

<sup>&</sup>lt;sup>5</sup> WEI. <u>2020 Safe Yield Recalculation</u>. Prepared for the Chino Basin Watermaster. May 2020.

#### **Chapter 1**

#### **Background and Objectives**

scenarios based on current planning data, some of which is documented in this report. The 2025 SYR constitutes the "more significant evaluation, including modeling, as described in the Reset Technical Memorandum" described in the 2017 Court Order. Therefore, more detailed analysis and documentation of the annual data collection and evaluation (e.g., land use, regional water infrastructure) will be part of the report that will be developed documenting the 2025 SYR, which is expected to be published in spring 2025. The budget for this work is outlined in the Watermaster Engineering budget for FY 2024/25.

#### 1.3 REPORT OBJECTIVES AND ORGANIZATION

The objectives of this report are to document the data collection and evaluation for the period through FY 2022/23 and document the associated peer review. For this report, the peer review consisted of a draft report presentation, soliciting comments over the period from May 29, 2024 to July 8, 2024, and responding to the comments. The remaining sections of the FY 2022/23 report are organized as follows:

**Chapter 2 – Groundwater Pumping.** Chapter 2 describes the collection and evaluation of data characterizing the groundwater pumping patterns and water supply plans in the Chino Basin.

**Chapter 3 – Urban Outdoor Water Use.** Chapter 3 describes the collection and evaluation of data characterizing the urban outdoor water use practices in the Chino Basin.

**Chapter 4 – Managed Groundwater Recharge.** Chapter 4 describes the collection and evaluation of data characterizing managed groundwater recharge in the Chino Basin, including data and projections for the recharge of stormwater, imported water, and recycled water.

Chapters 2 through 4 describe:

- A summary of the data type.
- Use of the data in the Chino Valley Model (CVM).
- A description of the data that were collected for this report and the assumptions for the development of the 2020 SYR Projection and the 2024 Projection.
- A comparison of the 2020 SYR Projection versus the 2019-23 Actual Data.
- A comparison of the 2020 SYR Projection versus an updated 2024 Projection for FY 2024-30.
- An evaluation of these comparisons to identify (i) the potential for undesirable results or (ii) the potential for a significant difference in the current expectations for net recharge during FY 2021-30 compared to the current Safe Yield for FY 2021-30.

**Chapter 5 – Conclusions and Recommendations.** Chapter 5 describes the cumulative assessment of all the data evaluated in this report, including the evaluation of Managed Storage, and the main conclusions and recommendations derived from these evaluations.

**Appendix A – Metering and Reporting of Groundwater Pumping for FY 2023.** Appendix A describes the wells in the Chino Basin for FY 2023, including descriptions of wells that were added or went out of service in the reporting year and information on wells that are not metered.

**Appendix B – Responses to Party Comments.** Appendix B documents the written comments received from the parties and responses.

# CHAPTER 2 Groundwater Pumping

Chapter 2 documents the collection and evaluation of data and information on groundwater pumping in the Chino Basin.

#### 2.1 SUMMARY AND APPLICATION TO MODEL

Groundwater pumping is the largest discharge component of the Chino Basin water budget, comprising roughly 83 percent of the total discharge from the Chino Basin from FY 1978 through 2018. The magnitude and location of groundwater pumping can affect groundwater levels, groundwater-flow directions, and the groundwater/surface-water interactions between the Chino Basin and the Santa Ana River and Prado Basin.

Groundwater pumping data is input into the 2020 CVM through the Well Package (McDonald et al., 1988)<sup>1</sup> of the groundwater model code, MODFLOW-NWT. The Well Package is used to simulate the withdrawal of groundwater from aquifers using a constant flow rate for each monthly stress period of the 2020 CVM.

Historical groundwater pumping data is one of several datasets used to calibrate the 2020 CVM. The 2020 CVM is calibrated over the period of July 1, 1977 through June 30, 2018 by adjusting model parameters to produce the best match between simulated and observed system responses, including the historical time series of surface water discharge in Prado Basin and groundwater levels at wells.<sup>2</sup>

Projections of future groundwater pumping are used to develop the model projection scenarios that are then simulated with the CVM to estimate the future water budget of the Chino Basin, including net recharge.

#### 2.2 COLLECTION OF DATA AND INFORMATION

This section describes how the data and information for groundwater pumping were collected and compiled for this report.

#### 2.2.1 2019-23 Actual Data

2019-23 Actual groundwater pumping data were developed from Watermaster's database of quarterly groundwater pumping data records and estimates. All members of the Appropriative and Overlying Non-Agricultural Pools, including the Chino Basin Desalter Authority (CDA), meter, record, and report pumping from their own wells. Wells owned by members of the Overlying Agricultural Pool are required to be metered if their pumping is greater than 10 afy (i.e., non-Minimal Producers), although metering is not feasible at all wells. Watermaster applies a water duty method to estimate the pumping for wells that are not metered.

<sup>&</sup>lt;sup>1</sup> McDonald, Michael G. and Harbaugh, Arlen W. 1988. MODFLOW, *A modular three-dimensional finite difference ground-water flow model*. Reston, Virginia: U. S. Geological Survey, 1988.

<sup>&</sup>lt;sup>2</sup> More information on the calibration process of the 2020 CVM can be found in Section 6 of the 2020 SYR Report. An updated CVM (the 2025 CVM) is being completed as part of the 2025 Safe Yield Reevaluation and is calibrated over the period of July 1, 1991 through June 30, 2022.

#### **2.2.2 2020 SYR Projection**

As part of the development of the Storage Framework Investigation in 2017, Watermaster submitted a comprehensive data request to each Appropriative Pool party and some of the larger Overlying Non-Agricultural Pool pumpers, including:

- Arrowhead Mountain Spring Water Company (Arrowhead)
- City of Chino (Chino)
- City of Chino Hills (Chino Hills)
- City of Norco (Norco)
- City of Ontario (Ontario)
- City of Pomona (Pomona)
- City of Upland (Upland)
- Cucamonga Valley Water District (CVWD)
- Fontana Water Company (FWC)
- Golden State Water Company (GSWC)
- Jurupa Community Services District (JCSD)
- Marygold Mutual Water Company
- Monte Vista Irrigation Company
- Monte Vista Water District (MVWD)
- Niagara Bottling, LLC (Niagara)
- Santa Ana River Water Company (SARWC)
- San Antonio Water Company (SAWCo)
- San Bernardino County Olympic Shooting Park
- West Valley Water District (WVWD)

The data request included future water supply plans, which represented the parties' best estimates of monthly demands and associated water supplies for the planning period of FY 2019 through 2050, including projections of groundwater pumping. In 2019, Watermaster asked the Parties to provide updates to their projections in preparation of the 2020 SYR Projection. Three Parties (Chino Hills, Pomona, and MVWD) updated their pumping projections. The data request also included a request for an updated list of active wells, well capacities, and the priority use for each well. This information was combined with the monthly water supply plans to distribute annual projected groundwater pumping to monthly projected pumping at each of the parties' wells to prepare the 2020 SYR Projection.

The 2020 SYR Projection of pumping for the smaller Overlying Non-Agricultural Pool parties was estimated using historical patterns. Pumping projections for the Agricultural Pool parties were based on a combination of historical data, projected land use changes, and projected water supply plans. The projected recharge and pumping operations for the Dry-Year Yield Program (DYYP) were uncertain and therefore not included in the 2020 SYR Projection.

#### 2.2.3 2024 Projection

In late 2023 and early 2024, as part of the current data collection and evaluation effort, Watermaster submitted a request to the municipal Appropriative Pool parties, the CDA, and the larger Overlying Non-Agricultural Pool parties for updated projected monthly demands and water supply plans (WSPs), current and future well information, and other information described in later sections. The projected monthly demands and WSPs were provided for FY 2025 and FY 2030. Watermaster developed the 2024 Projection for each party's WSP based on their responses to the data request, interpolating between 2023, 2025, and 2030.

The 2024 Projection for the Agricultural Pool and Overlying Non-Agricultural Pool pumping was developed based on a comparison of the 2020 SYR Projection and the 2019-23 Actual pumping to determine whether the differences suggested that the 2024 Projection should differ from the 2020 SYR Projection.

#### 2.3 EVALUATION

This section compares the 2020 SYR Projection for groundwater pumping to 2019-23 Actual pumping and the 2024 Projection for pumping, including an evaluation of any differences.

#### 2.3.1 2019-23 Actual Pumping versus 2020 SYR Projection

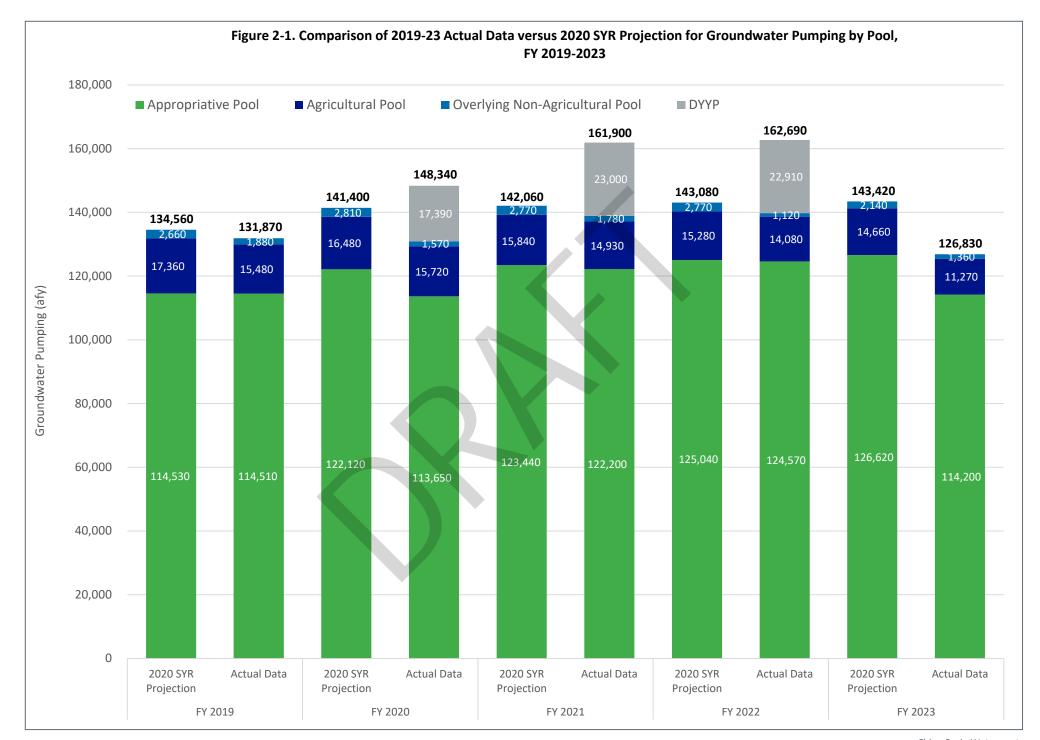

Figure 2-1 is a bar chart comparing 2019-23 Actual pumping to the 2020 SYR Projection for pumping by Pool, including the groundwater pumped for the DYYP. Figure 2-1 shows:

- On average, 2019-23 Actual pumping was greater than the 2020 SYR Projection by 5,400 afy. This was primarily due to pumping from the DYYP account in FY 2020, 2021, and 2022, which was not included in the 2020 SYR Projection.
- Not including the DYYP pumping, 2019-23 Actual pumping by the Agricultural Pool, Overlying Non-Agricultural Pool,<sup>3</sup> and the Appropriative Pool were less than the 2020 SYR Projection by about 1,600 afy, 1,100 afy, and 4,500 afy, respectively.

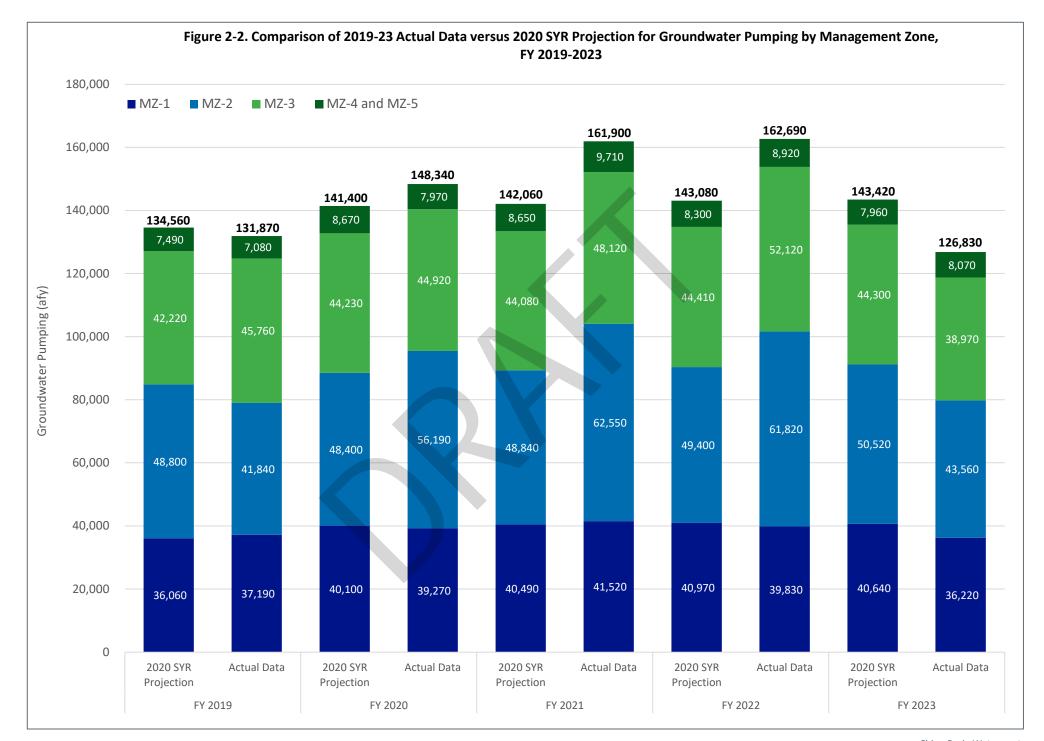

Figure 2-2 is a bar chart comparing 2019-23 Actual pumping to the 2020 SYR Projection for pumping by Management Zone (MZ). Groundwater pumping is aggregated for MZ-4 and MZ-5. Figure 2-2 shows:

- 2019-23 Actual pumping in MZ-1 was less than the 2020 SYR Projection by about 800 afy.
- 2019-23 Actual pumping in MZ-2 and MZ-3 was greater than the 2020 SYR Projection by about 6,100 afy. This was primarily due to pumping from the DYYP account in FY 2020, 2021, and 2022, which was not included in the 2020 SYR Projection.
- 2019-23 Actual pumping in MZ-4 and MZ-5 was about equal to the 2020 SYR Projection.

<sup>&</sup>lt;sup>3</sup> Annual groundwater pumping by General Electric is net zero because the agency injects the equivalent volume of groundwater pumped.

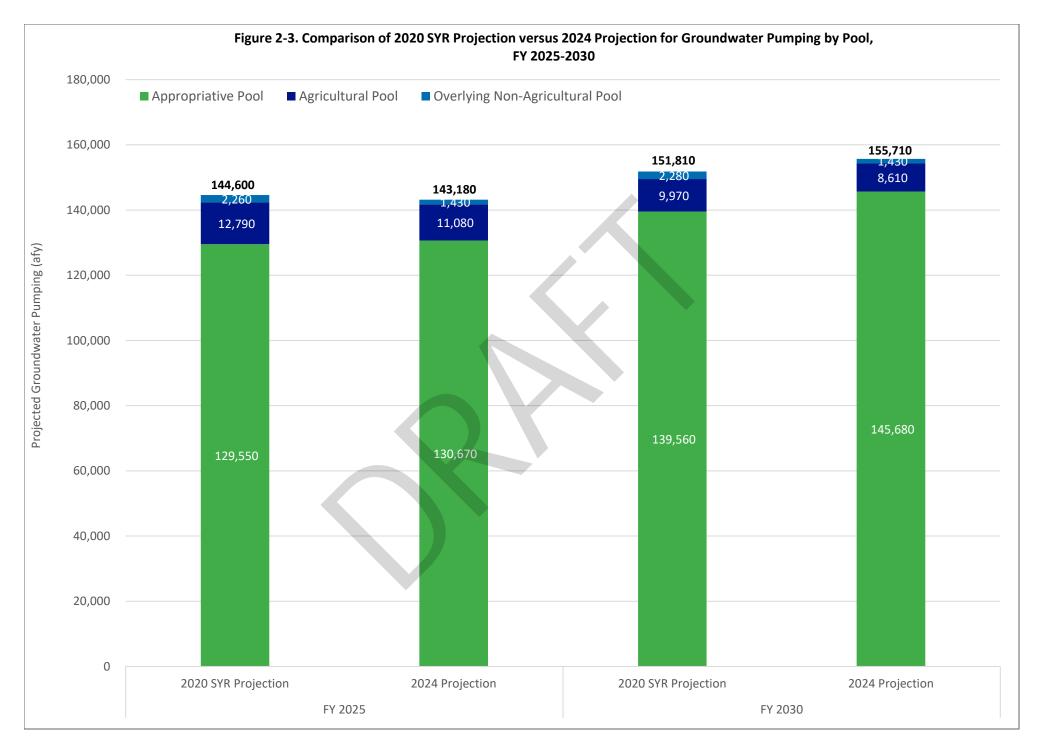

#### 2.3.2 2024 Projection versus 2020 SYR Projection

Figure 2-3 is a bar chart comparing the 2020 SYR Projection to the 2024 Projection for pumping by Pool for FY 2025 and FY 2030. Figure 2-3 shows:

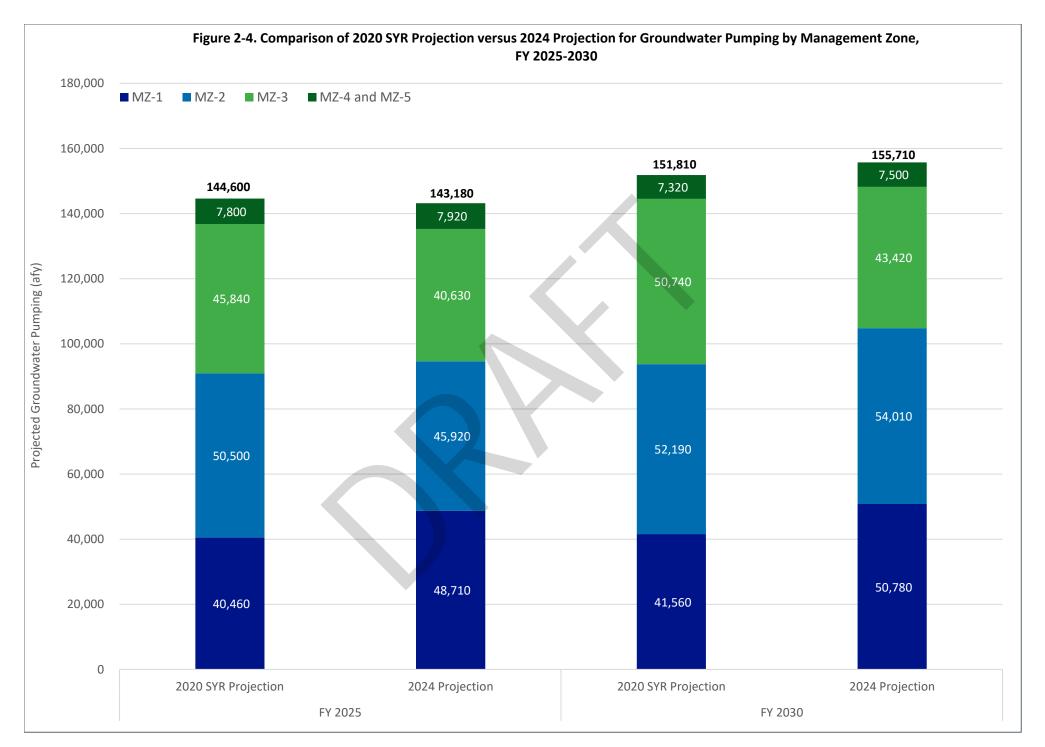

- The 2024 Projection for pumping is less than the 2020 SYR Projection by 1,400 afy in FY 2025 and greater than the 2020 SYR Projection by 3,900 afy in FY 2030. These differences are due to higher pumping projections provided by the Appropriative Pool Parties for the 2024 Projection and pumping projections for the Agricultural and Overlying Non-Agricultural Pools that are lower than the 2020 SYR Projection.
- The 2024 Projection for pumping by the Overlying Non-Agricultural Pool is 830 to 850 afy less than the 2020 SYR Projection. 2019-23 Actual pumping for the Overlying Non-Agricultural Pool has been consistently less than the 2020 SYR Projection; in addition, one Overlying Non-Agricultural Pool member (California Speedway Corporation) indicated in 2024 that projected pumping would be less than historical pumping. Hence, the 2024 Projection for Overlying Non-Agricultural Pool pumping is less than the 2020 SYR Projection.

Figure 2-4 is a bar chart comparing 2020 SYR Projection to the 2024 Projection for pumping by MZ for FY 2025 and FY 2030. Figure 2-4 shows:

• The greatest difference between the 2024 Projection and the 2020 SYR occurs in MZ-1. The 2024 Projection for pumping is greater than the 2020 SYR Projection in MZ-1 by 8,300 afy for FY 2025 and by 9,200 afy in FY 2030. These differences are due to higher pumping projections provided by the Appropriative Pool parties in MZ-1 for the 2024 Projection.

#### **2.3.3 Summary**

The main observations and conclusions from this section are:

- The 2019-23 Actual pumping was greater than assumed in the 2020 SYR Projection. The 2019-23 Actual pumping was greater than the 2020 SYR Projection by about 5,400 afy. This difference is primarily due to the groundwater pumping for the DYYP in FY 2020, 2021, and 2022, which generally occurred in northern MZ-2. Not including the DYYP pumping, 2019-23 Actual pumping by the Agricultural Pool, Overlying Non-Agricultural Pool, and the Appropriative Pool were less than the 2020 SYR Projection by about 1,600 afy, 1,100 afy, and 4,500 afy, respectively.
- The 2024 Projection pumping is similar to the 2020 SYR Projection. The 2024 Projection for pumping is less than the 2020 SYR Projection by 1,400 afy in FY 2025 and greater than the 2020 SYR Projection by 3,900 afy in FY 2030. The differences between the 2024 Projection and the 2020 SYR Projection for groundwater pumping are not expected to significantly impact net recharge.
- Differences between the 2024 Projection and the 2020 SYR Projection for pumping indicate the potential for increased risk of future undesirable results related to land subsidence. The 2024 Projection for pumping is greater than the 2020 SYR Projection in MZ-1 by 8,300 afy for FY 2025 and by 9,200 afy in FY 2030.
  - Some of the areas where the 2024 Projection for groundwater pumping is greater than the 2020 SYR Projection overlie the Northwest MZ-1 Area of Subsidence Concern where Watermaster is currently developing a subsidence management plan. Recent aquifer compaction modeling of this area in response to the 2020 SYR Projection of groundwater pumping and recharge indicates that inelastic subsidence is expected to occur through 2050.<sup>4</sup> These findings also demonstrate that the compaction is occurring primarily in the deeper aquifer layers, where some pumping occurs. The increase in managed recharge in surface spreading basins over the historical period (see Chapter 4) may have only a limited effect in mitigating subsidence.
  - Therefore, the differences between the 2024 Projection and the 2020 SYR Projection for groundwater pumping indicate the potential for an increased risk of future land subsidence. It should be noted that Watermaster currently conducts monitoring and management to address potential land subsidence through the implementation of the OBMP.

### CHAPTER 3 Urban Outdoor Water Use

Chapter 3 documents the collection and evaluation of data and information on outdoor urban water use practices in the Chino Basin.

#### 3.1 SUMMARY AND APPLICATION TO MODEL

Urban outdoor water use and the fate of these waters after use are a major driver of recharge in the Chino Basin. Typically, pervious urban landscapes are either covered with vegetation that is irrigated (e.g., lawns) or are unplanted and not irrigated. The soil underlying irrigated vegetation is usually moist, allowing some of the irrigation water and precipitation to infiltrate past the root zone to recharge the underlying groundwater basin. Changes in urban irrigation practices in response to climate, water conservation mandates, or other drivers affect the rates and volumes of infiltration of irrigation and precipitation past the root zone.

Urban outdoor water use was included in the 2020 CVM via the R4 model, which is used to calculate the deep infiltration of precipitation and applied water (DIPAW).<sup>1</sup> The R4 model estimates applied water based on soil type, vegetation type, irrigation method, precipitation, and ET. The R4 model calculates the soil moisture available for use by vegetation and determines the rates/volumes of applied water needed for irrigation. The R4 model estimates the infiltration of applied water and precipitation past the root zone that constitutes DIPAW. The R4 model was calibrated to match urban outdoor water use patterns in areas where there are sufficient data to estimate urban outdoor water use; specifically, these areas are tributary to Inland Empire Utilities Agency's (IEUA) major wastewater treatment plants (sewersheds) from FY 1991 through 2018.

For the 2020 SYR, the R4 model was calibrated by comparing estimated actual potable urban outdoor water use with the model-simulated applied water on residential, commercial, and industrial land uses. Recycled water applied for irrigation was not considered in the calibration because it had historically been a small portion of the irrigation water applied to these land uses. Land uses such as parks, golf courses, and schools were excluded from the calibration, as they are generally irrigated with recycled water.

Projections of future urban outdoor water use using the R4 model rely on projections of future precipitation, evapotranspiration (ET), land use, and irrigation behavior. Trends in urban outdoor water use are important to understand as they affect DIPAW, which affects groundwater levels and the water budget, including net recharge.

#### 3.2 COLLECTION OF DATA AND INFORMATION

This section describes how the data and information for urban outdoor water use were collected and compiled for this report.

**WEST YOST** 

<sup>&</sup>lt;sup>1</sup> See <u>Appendix A of the 2007 CBWM Groundwater Model Documentation and Evaluation of the Peace II Project Description</u> (WEI, 2007).

#### 3.2.1 2019-23 Actual Data

Estimates for actual urban outdoor water use are derived from data collected from IEUA's two major sewersheds that cover most of the Chino Basin, which are the RP1/RP4 and Carbon Canyon (CC)/RP5 sewersheds. The methodology to derive estimates of urban outdoor water use was:

- 1. Obtain data from IEUA for monthly recycled water deliveries to customers in the sewershed that use recycled water for outdoor irrigation.
- 2. Obtain data from IEUA (and/or the Parties overlying the sewershed) for monthly potable water deliveries to the sewershed.
- 3. Obtain from each Party overlying the sewershed the annual estimates of the potable water delivery losses.
- 4. Obtain from IEUA the monthly sewage inflow to the wastewater treatment plants (i.e., estimated indoor water use).
- 5. Estimate the monthly dry-weather discharge using available discharge estimates from the USGS gage on Cucamonga Creek.
- 6. Estimate the monthly discharge from on-site waste disposal systems (OWDS) overlying the sewershed.
- 7. Calculate the monthly urban outdoor water use by using the formula:

**Urban Outdoor Water Use** = [Water delivered to watershed] – [Water not used for irrigation]

or

**Urban Outdoor Water Use** = [(1) + (2)] - [(3) + (4) + (5) + (6)]

#### 3.2.2 2020 SYR Projection

In the 2020 SYR, projected urban outdoor water use was estimated with the R4 model based on the calibrated parameters and the following assumptions:

- Average expected-value hydrology adjusted for climate change. The methodology used for the 2020 SYR calls for the use of the "long-term historical record of precipitation falling on current and projected future land uses to estimate the long-term average net recharge to the Basin" (WEI, 2015). Future precipitation and ET datasets used in the R4 model were based on the historical datasets for the period FY 1950 through 2011, which were adjusted for future climate conditions based on the method recommended by the California Department of Water Resources (DWR) for use in groundwater models to simulate future water budgets pursuant to the Sustainable Groundwater Management Act (SGMA) (DWR, 2018).<sup>2,3</sup>
- The impact of current and future urban outdoor water use conservation legislation was not included. On April 1, 2015, Governor Jerry Brown released Executive Order B-29-15,

<sup>&</sup>lt;sup>3</sup> DWR. Resource Guide - DWR-provided Climate Change Data and Guidance for Use During Groundwater Sustainability Plan Development. 2018.

<sup>&</sup>lt;sup>2</sup> More detail on the development of future hydrology can be found in Section 7 of the 2020 SYR Report.

which mandated a statewide reduction in urban potable water usage of 25 percent through February 2016. Additionally, in 2018 the California legislature passed, and the Governor signed, two pieces of legislation (AB 1668 & SB 606) that led to the "Making Conservation a California Way of Life" regulation (Conservation Regulation)<sup>4</sup> to establish new water efficiency standards for purveyors in response to the California drought. At its inception, the legislation would require water suppliers to meet agency-specific urban water use objectives beginning in 2027. Details on the implementation of this legislation were insufficient at the time to include in the 2020 SYR Projection. The 2020 SYR Projection assumed that outdoor water use patterns for legacy urban areas would reflect recent historical patterns. Areas projected for future development would implement more efficient outdoor water use consistent with the guidance provided in the DWR's 2015 Model Water Efficient Landscape Ordinance.<sup>5</sup>

The methodology to calculate the annual 2020 SYR Projection of FY 2019-23 actual urban outdoor water use was:

- 1. For 2018 and 2030 cultural conditions<sup>6</sup>:
  - The HSPF and R4 models are executed with historical data from 1950 through 2011. For the 2030 cultural conditions, the historical data was modified to account for climate change.
  - The average monthly urban outdoor water use for each sewershed was calculated based on the results of the HSPF and R4 simulations. For example, the average urban outdoor water use for the month of January is the average of every January over the 1950-2011 period.
- 2. The projected urban outdoor water use<sup>7</sup> for Fiscal Year 2019 through Fiscal Year 2023 was calculated by linearly interpolating the average monthly outdoor water use between 2018 and 2030 cultural conditions.

#### 3.2.3 2024 Projection

The 2024 Projection for urban outdoor water use was developed by reexamining the assumptions used to develop the 2020 SYR Projection, reviewing historical patterns, and reviewing the status of the Conservation Regulation to predict its impact on urban outdoor water use.

In addition, as part of the 2025 Safe Yield Reevaluation (2025 SYR) scenario development, Watermaster has had discussions with the parties regarding projected future water supply plans and urban outdoor water use patterns.

#### 3.3 EVALUATION

This section compares the 2020 SYR Projection to the 2019-23 Actual Data and the 2024 Projection for urban outdoor water use and evaluates the significance of the differences.

<sup>&</sup>lt;sup>4</sup> Making Conservation a California Way of Life Fact Sheet

<sup>&</sup>lt;sup>5</sup> DWR. *Model Water Efficient Landscape Ordinance*. Accessed March 25, 2022.

<sup>&</sup>lt;sup>6</sup> See Section 7.3 of the 2020 SYR Report for a detailed description of the present and projected future cultural conditions.

<sup>&</sup>lt;sup>7</sup> The projected urban outdoor water use includes applied water on residential, commercial, industrial, and municipal land uses. This includes parks, golf courses, and schools.

#### 3.3.1 2019-23 Actual Data versus 2020 SYR Projection

Figure 3-1 compares the FY 2019-23 Actual urban outdoor water use to the 2020 SYR Projection. The 2019-23 Actual urban outdoor water use varies from year to year due to weather, population growth, water conservation measures, infrastructure improvements, and economic factors. In contrast, the 2020 SYR Projection remains relatively constant since it is based on an average expected-value hydrology. From FY 2019 to FY 2023, the Actual urban water use was consistently less than the 2020 SYR Projection by about 21,100 afy. Multiple drivers may account for this difference, including systemic behavioral changes following Executive Order B-29-15, infrastructure improvements, and the imported water restrictions and associated outdoor watering restrictions that occurred in 2022 in response to the drought. The historical period included three years of below-average precipitation (2020-2022) and two years of above-average precipitation (2019 and 2023), which should roughly balance the impact of wet and dry years on urban outdoor water use.

#### 3.3.2 2024 Projection versus 2020 SYR Projection

Since 2018, the State Water Resources Control Board (State Board) and the DWR have been developing new water use efficiency standards for urban retail water suppliers. In October 2023, the State Board released the first draft of the proposed Conservation Regulation. Following comments from the public, the State Board released multiple revised drafts in early 2024 before adopting the Conservation Regulation on July 3, 2024. The Conservation Regulation will take effect in January 2025, with compliance expected to be assessed beginning in 2027.

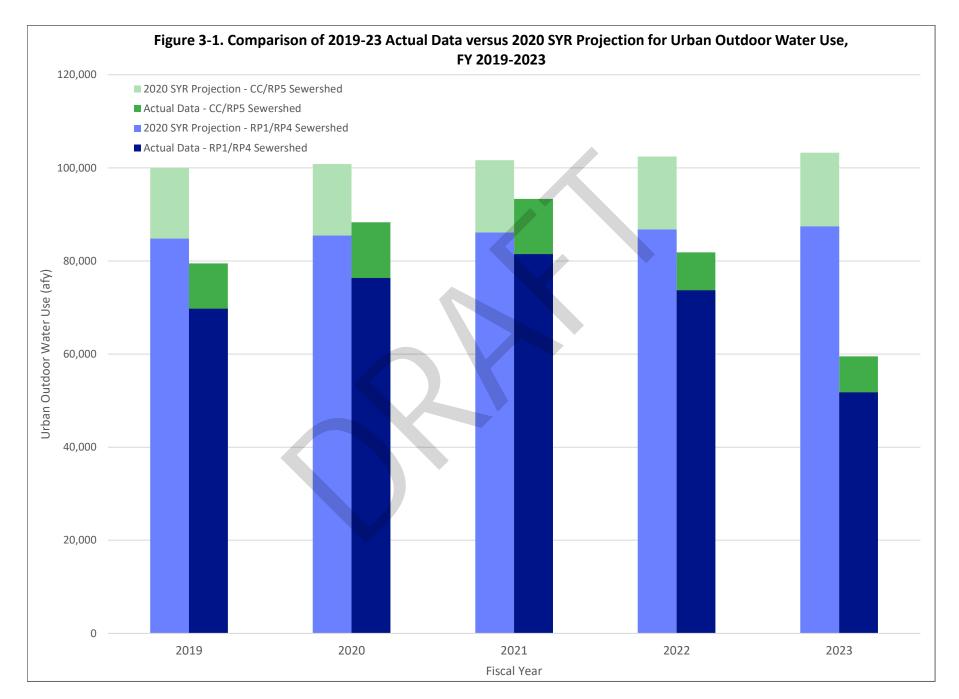

The proposed Conservation Regulation requires the calculation of a budget for residential outdoor water use, incorporating a landscape efficiency factor linked to irrigable area, with future reductions slated for 2035 and 2040 to promote water-efficient landscaping practices. The parties that would be subject to the Conservation Regulation have indicated significant uncertainty in their customers' responses to the Conservation Regulation. Through scenario design workshops for the 2025 SYR, parties underscored the substantial impact of policy and regulation on water supply planning, particularly emphasizing uncertainties stemming from the Conservation Regulation.<sup>9</sup>

The parties' continued input and available data are being used to develop multiple future scenarios to encompass the range of potential outcomes and uncertainties surrounding future urban outdoor water use. This process is ongoing and is expected to be completed in summer 2024.

A precise 2024 Projection for urban outdoor water use was not possible for this report because (1) the proposed Conservation Regulation was only recently adopted and (2) there remains a high degree of uncertainty in agencies' responses to the Conservation Regulation and other unrelated changes in urban outdoor water use. However, the expected impacts from the Conservation Regulation suggest a probable reduction in future urban outdoor water use compared to both the 2019-23 Actual Data and the 2020 SYR Projection.

<sup>&</sup>lt;sup>8</sup> <u>Proposed text of Conservation Regulation that was adopted on July 3, 2024.</u> As of this report, the Conservation Regulation text is being circulated for a sixth review period ending on August 12, 2024. The review period is expected to result in minor corrections and will not require the State Board to re-approve the Conservation Regulation.

<sup>&</sup>lt;sup>9</sup> Slides from 2025 SYR Scenario Design Workshop #1

#### **3.3.3 Summary**

The main observations and conclusions of this section are:

- The cumulative impacts of differences in outdoor urban water use may result in reduced net recharge compared to the current Safe Yield. The average 2020 SYR Projection for urban outdoor water use between 2019 and 2023 was 21,100 afy greater than the average 2019-23 Actual urban outdoor water use within the IEUA service area, which likely resulted in less DIPAW to the vadose zone than was simulated in the 2020 SYR. While a more precise estimate of the impacts of these differences requires the use of the CVM, the impact can be approximated with the following assumptions:
  - 1. The IEUA service area serves as a representative proxy for the entire Chino Basin.
    - The IEUA service area covers about 80 percent of the Chino Basin, but its total service area is similar to the size of the Chino Basin.
    - Similar reductions in urban outdoor water use likely occurred in areas of the Chino Basin outside of the IEUA service area.
    - Therefore, the difference in FY 2019-23 urban outdoor water use compared to the 2020 SYR Projection could be around -21,100 afy across the Basin, rounded to -20,000 afy.
  - 2. The differences in urban outdoor water use likely resulted from less irrigated area and less frequent irrigation compared to the 2020 SYR Projection. The differences in urban outdoor water use may result from behavioral changes including increased irrigation efficiency (e.g., replacing sprinklers with drip irrigation), conversion to water-efficient vegetation (i.e., a lower crop coefficient), reduced irrigated area, and reduced irrigation frequency. Each of these changes will have a different impact on DIPAW relative to the change in applied water. We estimate that about 20 to 40 percent of the differences in urban outdoor water use would have resulted to DIPAW to the vadose zone, with the other 60 to 80 percent being consumed by the irrigated vegetation.<sup>10</sup>

Combining these assumptions, the DIPAW to the vadose zone could range from about 4,000 to 8,000 afy (20,000 afy \* 20 percent, or 20,000 afy \* 40 percent) less than that simulated in the 2020 SYR over FY 2019-23. While a precise 2024 Projection for urban outdoor water use was not possible, based on the available information and the 2019-23 Actual Data, it is likely that future urban outdoor water use will continue to be less than the 2020 SYR Projection. Although the impacts of these differences will have a delayed impact on the net recharge due to the travel time through the vadose zone, these differences may result in the average net recharge over the current decade to be less than the current Safe Yield.

<sup>&</sup>lt;sup>10</sup> See comments from Cucamonga Valley Water District in Appendix B. Input from the Appropriators and the Chino Basin Water Conservation District indicates typical irrigation efficiencies of residential landscapes of about 40-50 percent, with commercial irrigation efficiencies approaching 65-70 percent. These irrigation efficiencies consider water losses to runoff, which are not simulated in the R4 model and are removed from the calculations of actual urban outdoor water use (see Step 5 in Section 3.2.1). Therefore, the observed differences between actual urban outdoor water use and the 2020 SYR Projection include only water consumed by vegetation and water resulting in deep infiltration to the vadose zone. The assumption of 20 to 40 percent of applied water (excluding runoff) resulting in DIPAW to the vadose zone is consistent with R4 model assumptions and aligns with findings in relevant literature.

## CHAPTER 4 Managed Groundwater Recharge

Chapter 4 documents the collection and evaluation of data and information on managed groundwater recharge in the Chino Basin.

#### 4.1 SUMMARY AND APPLICATION TO MODEL

Managed groundwater recharge (also known as managed aquifer recharge or managed recharge) is the deliberate recharge of surface water to an aquifer. Watermaster has collaborated with the Parties and local agencies to enhance managed recharge in the Chino Basin through the implementation of Program Element 2 of the Optimum Basin Management Program (OBMP), which is to develop and implement a comprehensive recharge program.

The types of water recharged in the Chino Basin include stormwater and supplemental water. Stormwater is the runoff generated from rainfall within the Chino Basin watershed, some of which can be routed to recharge facilities within the Chino Basin. Stormwater recharge varies from year to year, and the volume of recharge is dependent on precipitation, which is highly variable, and the capacity and operation of the recharge facilities. Supplemental water includes recycled water and water that originates from outside the Chino Basin (i.e., imported water from the State Water Project). Supplemental water recharge is also highly variable and is dependent on the water-supply plans of the Parties, actions and coordination with outside agencies recharging in the Chino Basin (e.g., MWD's DYYP), the availability of supplemental water supplies, and the capacity and operation of the recharge facilities.

Managed recharge occurs in the Chino Basin via spreading of surface water at recharge basins, injection at aquifer storage and recovery (ASR) facilities, infiltration at Municipal Separate Storm Sewer System (MS4) facilities, and in-lieu recharge, all of which are documented in detail in the 2023 Recharge Master Plan Update (2023 RMPU). Each method for managed recharge is listed below, including a description of how each of these recharge terms are input into the CVM:

- Recharge Basins. Recharge basins are the flood control and conservation basins that the
  IEUA, Chino Basin Water Conservation District (CBWCD), and the San Bernardino County
  Flood Control District own and operate. Recharge at these basins is input to the CVM as a
  specified inflow at the model cells corresponding to the recharge basins. Figure 4-1 shows
  the locations of the recharge basins in the Chino Basin where managed recharge occurs.
- Aquifer Storage and Recovery Facilities. ASR facilities are wells that are equipped for the
  injection of surface water and extraction of groundwater. Data for the injection and
  extraction of water from the ASR facilities are input into the CVM as a specified inflow at the
  location of the ASR well. Figure 4-1 shows the locations of the current and known future ASR
  facilities in the Chino Basin.
- MS4 Facilities. MS4 facilities include facilities to capture stormwater runoff in an urban area. Los Angeles, San Bernardino, and Riverside Counties, and/or the cities within these counties, have MS4 facilities in the Chino Basin. A reconnaissance-level study completed during the development of the 2023 RMPU estimated that there were 193 known MS4 facilities that have been constructed in the Chino Basin through FY 2021 that included infiltration features that would contribute to stormwater recharge in the Chino Basin. The data that has been collected on the performance and maintenance of the MS4 facilities has been insufficient to quantify

**WEST YOST** 

<sup>&</sup>lt;sup>1</sup> West Yost. 2023 Recharge Master Plan Update. Prepared for the Chino Basin Watermaster. September 2023.

#### **Chapter 4**

#### **Managed Groundwater Recharge**

the historical or projected contribution of these facilities to new recharge in the Chino Basin. The CVM does not explicitly account for recharge at these facilities.

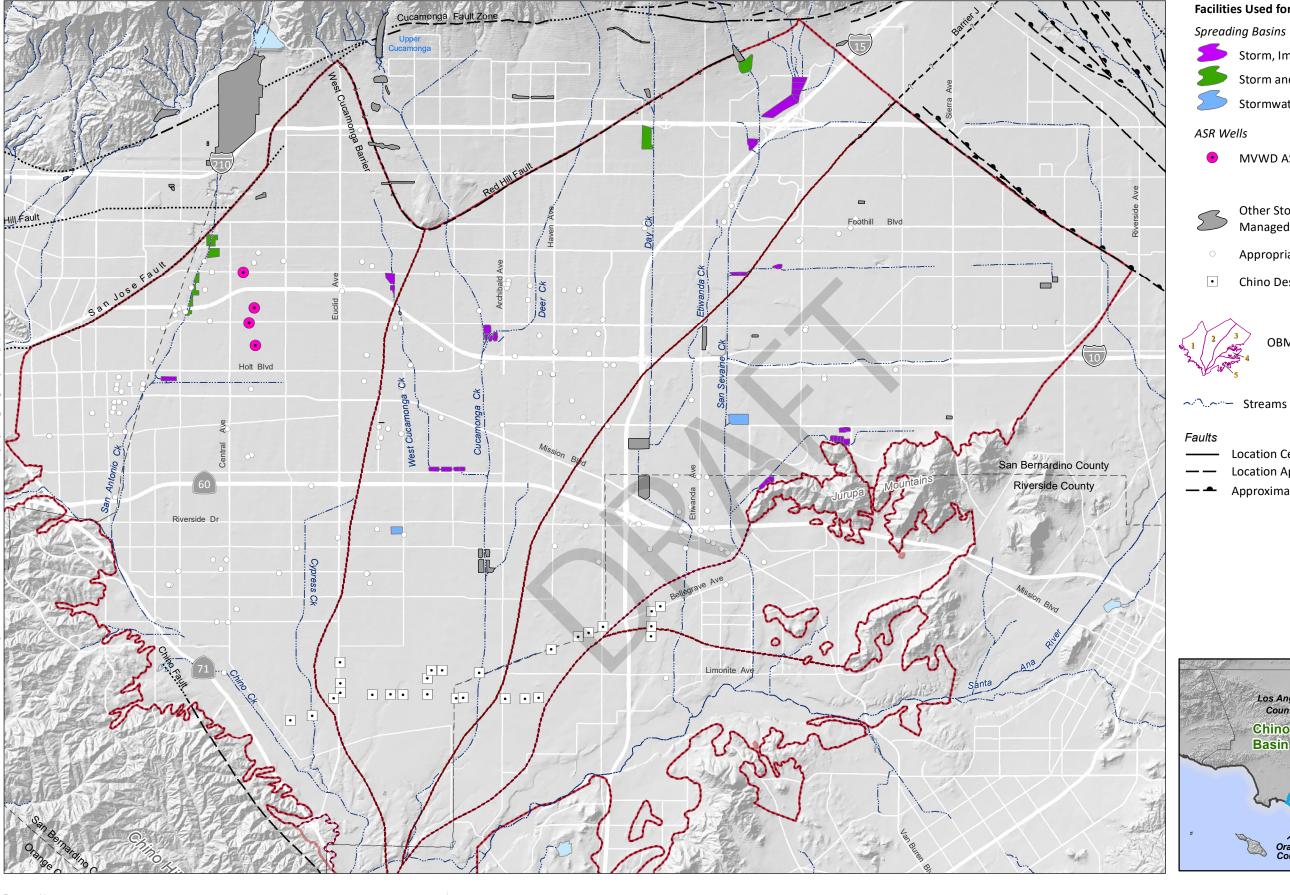

• In-lieu Recharge. In-lieu recharge can occur when a Party with pumping rights in the Chino Basin uses supplemental water for direct use in lieu of pumping Chino Basin groundwater. The ability of a Party to conduct in-lieu recharge depends on the extent of a Party's access to treatment and conveyance facilities for imported water. In-lieu recharge is reflected in a Party's water supply plan and is not a direct input into the CVM.

Historical data on managed recharge is one of several input datasets in the CVM calibration scenario. The CVM's R4 surface water model is calibrated to match the IEUA's estimates of stormwater recharge at recharge basins. The 2020 CVM groundwater-flow model was calibrated over the period of July 1, 1977 through June 30, 2018 by adjusting model parameters to produce the best match between simulated and observed system responses, including the time series of surface water discharge into the Prado Dam reservoir and groundwater levels at wells.<sup>2</sup>

Projections of future managed recharge are used to develop the model projection scenarios, that are then simulated with the CVM to estimate the future water budget of the Chino Basin, including net recharge. Managed recharge patterns (magnitude and location) are important as they affect groundwater levels, water budget components, and net recharge in the Chino Basin.

<sup>&</sup>lt;sup>2</sup> More information on the calibration process of the 2020 CVM can be found in Section 6 of the 2020 SYR Report.

#### **Managed Groundwater Recharge**

#### 4.2 COLLECTION OF DATA AND INFORMATION

This section describes how the data and information for managed recharge were collected and compiled for this report.

#### 4.2.1 Stormwater Recharge

#### 4.2.1.1 2019-23 Actual Data

Stormwater recharge is metered at each recharge basin by the IEUA. The IEUA provides Watermaster the daily and monthly measurements of stormwater diverted to each recharge basin. Watermaster maintains these data in a database.

#### 4.2.1.2 2020 SYR Projection

For the 2020 SYR, projections of stormwater recharge at recharge basins were estimated with the R4 model based on the following assumptions:

- Average expected-value hydrology adjusted for climate change. The Safe Yield Reset methodology employed for the 2020 SYR calls for the use of the "long-term historical record of precipitation falling on current and projected future land uses to estimate the long-term average net recharge to the Basin." Future precipitation and ET datasets used in the R4 model are based the historical datasets for the period of FY 1950 through 2011, which were adjusted for future climate conditions based on the method recommended by the DWR for model simulations of future water budgets pursuant to the SGMA (DWR, 2018).<sup>3</sup> The average stormwater recharge calculated based on historical precipitation and ET datasets represents the expected-value stormwater recharge that was used for the 2020 SYR Projection.
- 2013 RMPU projects would be fully operational by FY 2023. During the development of the 2020 SYR Projection, the design and construction of the approved recharge enhancement projects in the 2013 RMPU were underway. The assumptions in the 2020 SYR Projection were that all approved 2013 RMPU projects would be completed by FY 2023, at which point the expected stormwater recharge increases by the R4-estimated volumes for each project.

#### 4.2.1.3 2024 Projection

The 2024 Projection was developed by reexamining the assumptions used to develop the 2020 SYR Projection. Since the development of the 2020 SYR Projection, there is no updated information that would necessitate a change in the data or methods used to develop the expected-value hydrology used in the 2020 SYR Projection. Two of the 2013 RMPU projects were delayed past FY 2023: (1) Montclair Basin improvements and (2) Wineville/Jurupa/RP3 Basin pump station and improvements (Project 23a). As of this writing, the Montclair Basin improvements and Project 23a are expected to be completed by the end of December 2025 and fully operational in FY 2027. The expected stormwater recharge benefits of the Montclair Basin improvements and Project 23a are 96 afy and 2,921 afy, respectively. There are no additional stormwater recharge projects planned for construction through FY 2030.

**WEST YOST** 

<sup>&</sup>lt;sup>3</sup> More detail on the development of future hydrology can be found in Section 7 of the 2020 SYR Report.

#### **Managed Groundwater Recharge**

#### 4.2.2 Recycled Water Recharge

#### 4.2.2.1 2019-23 Actual Data

Recycled water recharge is metered at each recharge basin by the IEUA. The IEUA provides Watermaster the daily and monthly measurements of recycled water delivered to each recharge basin, adjusted for evaporative losses. Watermaster maintains these data in a database.

#### 4.2.2.2 2020 SYR Projection

The IEUA provided projections of future annual recycled water recharge at each recharge basin. The Watermaster Engineer reduced the IEUA projections for the 2020 SYR Projection to be more consistent with the then-recent history of recycled water recharge that occurred prior to FY 2019.

#### 4.2.2.3 2024 Projection

The IEUA provided updated recycled water recharge projections in 2024.

#### 4.2.3 Imported Water Recharge

#### 4.2.3.1 2019-23 Actual Data

Imported water recharge is metered at each recharge basin by the IEUA. The IEUA provides Watermaster the daily and monthly measurements of imported water delivered to each recharge basin, adjusted for evaporative losses. Volumes of imported water injected into ASR wells in the Chino Basin are reported to Watermaster quarterly by the well owners. Watermaster maintains these data in a database.

#### 4.2.3.2 2020 SYR Projection

For the 2020 SYR Projection, estimates of future imported water recharge were based on the following:

- Storage and Recovery Programs. The only active Storage and Recovery Program in the Chino Basin is the DYYP. This program involves the recharge of imported water in the Chino Basin for later extraction via Chino Basin wells. At the end of the calibration period (June 30, 2018), the DYYP had a balance of about 41,380 af. The future operations of the DYYP were uncertain beyond the calibration period, so no recharge for the DYYP was included in the 2020 SYR Projection.
- Peace II Agreement requirements. Pursuant to the Peace II Agreement, 6,500 afy of supplemental water must be recharged in MZ-1 through 2030. The 2020 SYR Projection assumed that "this obligation will be satisfied through the recharge of imported water for the [DYYP] that has already occurred and recycled water recharge planned to occur in MZ1 through 2030." (2020 SYR Report).
- Replenishment obligations. Imported water was assumed to be recharged in the future to satisfy the replenishment obligations of the Parties. To estimate the volume of

#### **Chapter 4**

#### **Managed Groundwater Recharge**

replenishment obligations and Managed Storage,<sup>4</sup> Watermaster compared estimates of future pumping to future pumping rights, as summarized below.<sup>5</sup>

- Projections of future pumping rights were based on the Safe Yield (through FY 2020), projected average net recharge (for each decade after FY 2020), Reoperation water, and projected recycled water recharge.
- If projected pumping was greater than projected pumping rights, the difference was the replenishment obligation. It was assumed that the replenishment obligation would be satisfied 80 percent by debits from Managed Storage accounts and the remaining 20 percent by wet-water (imported water) recharge.
- Projected imported water recharge at ASR wells. No imported water was assumed to be recharged via ASR wells in the 2020 SYR.

The projected imported water recharge was allocated to specific recharge basins based on the recommendation in the 2023 RMPU (West Yost, 2023), which stated the following:

"West Yost's recommendation to Watermaster regarding the location and magnitude of supplemental water recharge for replenishment has been to maximize recharge to MZ1 up to its spreading capacity, then to maximize recharge in MZ3 up to its recharge capacity, and then to recharge in MZ2. Given that the long-term land subsidence management plan for Northwest MZ1 has not yet been completed and there are no projected recharge-related pumping substantiality challenges which can be practically mitigated through recharge, the existing strategy and the facilities on which it relies are sufficient at least until the next RMPU occurs in 2028. This includes continuing the recharge of at least 6,500 afy of supplemental water in MZ1 until the next RMPU occurs in 2028 or the MZ1 subsidence management plan is completed."

#### 4.2.3.3 2024 Projection

For the 2024 Projection, estimates of future imported water recharge were based on the following:

- Storage and Recovery Programs. The only active Storage and Recovery Program remains the DYYP, which had a balance of about 7,900 af at the end of FY 2023. No recharge for the DYYP was included in the 2024 Projection.
- Peace II Agreement requirements. The Peace II Agreement requirements remain
  unchanged, thus 6,500 afy of supplemental water must continue to be recharged in MZ-1
  through 2030. It is still assumed that "this obligation will be satisfied through the recharge
  of imported water for the [DYYP] that has already occurred and recycled water recharge
  planned to occur in MZ1 through 2030."
- Replenishment obligations. The 2024 Projection for Managed Storage and replenishment obligations is based on the same methods as prior years. In 2022, as part of Watermaster's data request to the Appropriative Pool Parties, Watermaster requested 20-year operating plans for groundwater pumping, transfers, and the use of Managed Storage to meet any

<sup>&</sup>lt;sup>4</sup> Managed Storage, as used herein, refers to water stored by the Parties and other entities, and includes Carryover, Local Storage, and Supplemental Water held in storage accounts by the Parties, and Storage and Recovery Programs.

<sup>&</sup>lt;sup>5</sup> More detail on the methods to calculate the replenishment obligation can be found in Section 7.3.1.2 of the 2020 SYR Report.

#### **Chapter 4**

#### **Managed Groundwater Recharge**

future replenishment obligations. Based on the Parties' responses, the average percentage<sup>6</sup> of future replenishment obligations that the Parties expected to meet through debits from Managed Storage accounts was about 90 percent, with the other 10 percent expected to be met with imported water recharge. Most of the Parties expressed some uncertainty in these estimates, noting that future availability and cost of imported water has been more volatile in recent years. Future work will consider an approach that estimates each party's individual responses to use Managed Storage to meet replenishment obligations.

• **Projected imported water recharge at ASR wells.** The Parties indicated that no imported water should be assumed to be recharged via ASR wells in the 2024 Projection.

#### 4.3 EVALUATION

This section compares the 2020 SYR Projection to the 2019-23 Actual Data and the 2024 Projection for managed recharge and evaluates the significance of the differences. Figure 4-2 compares the 2019-23 Actual Data, 2020 SYR Projection, and the 2024 Projection for managed recharge by type for FY 2019-2030.

#### 4.3.1 Stormwater Recharge

#### 4.3.1.1 2019-23 Actual Data versus 2020 SYR Projection

Year-to-year, the 2019-23 Actual stormwater recharge was sometimes greater and sometimes less than stormwater recharge in the 2020 SYR Projection, which is to be expected given the interannual variability in precipitation. On average, the 2019-23 Actual stormwater recharge was about the same as the 2020 SYR Projection (11,200 afy).

#### 4.3.1.2 2024 Projection versus 2020 SYR Projection

Due to the delay of the completion of the Montclair Basin improvements and Project 23a, the 2024 Projection of stormwater recharge is less than the 2020 SYR Projection. A minor portion of Project 23a is complete as of FY 2023/24 (the construction of a new cell at RP3); however, the reduced recharge opportunity due to the project delays is uncertain due to project design and hydrologic conditions. Assuming that the lost recharge opportunity due to project delays is about 2,000 afy over three years (FY 2024-26), the 2024 Projection for stormwater recharge averages 13,400 afy, about 900 afy less than the 2020 SYR Projection (14,300 afy).

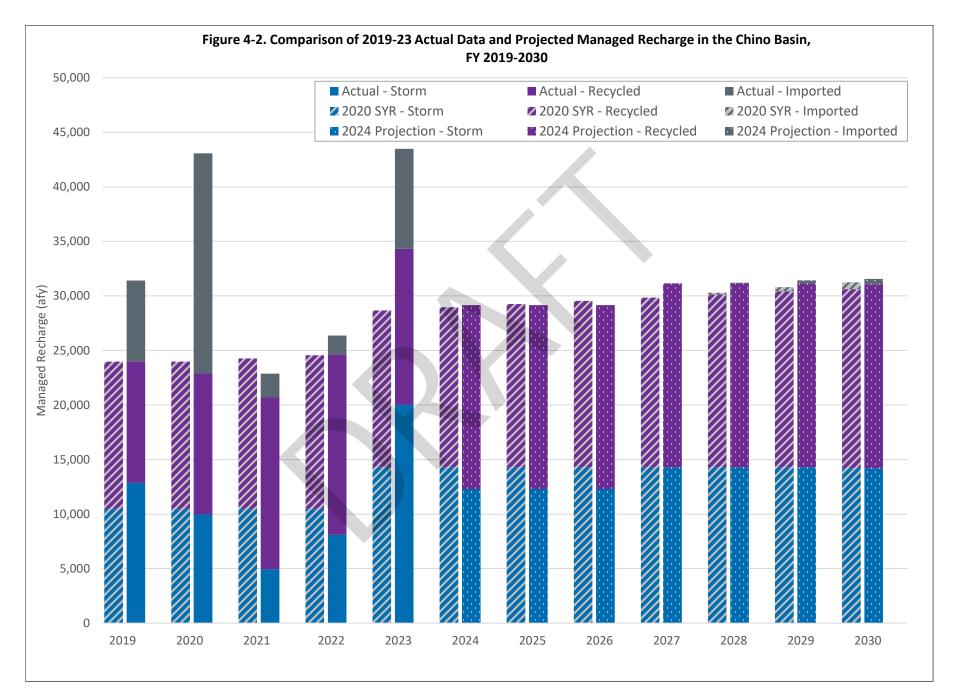

#### 4.3.2 Recycled Water Recharge

#### 4.3.2.1 2019-23 Actual Data versus 2020 SYR Projection

On average, the 2019-23 Actual recycled water recharge was 14,130 afy, about 280 afy greater than the 2020 SYR Projection (13,850 afy).

\_

<sup>&</sup>lt;sup>6</sup> A volume-weighted average percentage was calculated based on each Party's respective Managed Storage account balance at the end of FY 2022.

#### **Managed Groundwater Recharge**

#### 4.3.2.2 2024 Projection versus 2020 SYR Projection

The 2024 Projection for recycled water recharge is 16,850 afy, or about 1,300 afy greater than the 2020 SYR Projection (15,550 afy).

#### 4.3.3 Imported Water Recharge

#### 4.3.3.1 2019-23 Actual Data versus 2020 SYR Projection

On average, the 2019-23 Actual imported water recharge was greater than the 2020 SYR Projection by about 8,100 afy. This is almost entirely due to imported water recharge for the DYYP during FY 2019, 2020, and 2023.

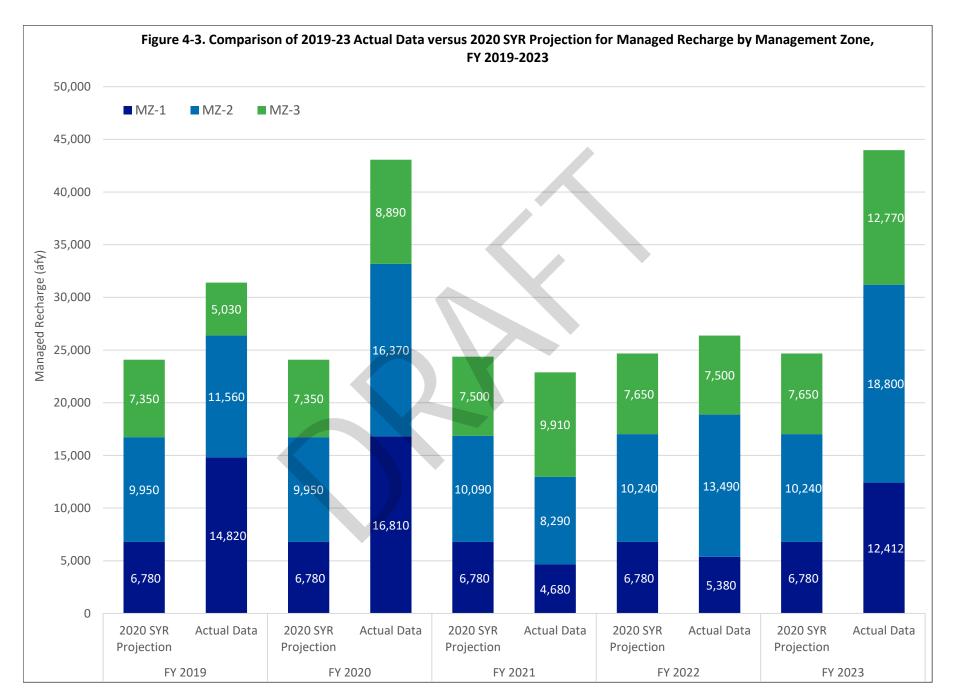

#### 4.3.3.2 2024 Projection versus 2020 SYR Projection

The 2024 Projection for imported water recharge during FY 2024 through 2030 is about 120 afy, slightly lower than the 2020 SYR Projection, which was about 170 afy.

#### **4.3.4 Summary**

The main observations and conclusions from this section are:

- The 2019-23 Actual managed recharge in MZ-1 was greater than assumed in the 2020 SYR Projection. Figure 4-3 compares the 2019-23 Actual managed recharge to the 2020 SYR Projection by MZ. The 2019-23 Actual managed recharge was greater than the 2020 SYR Projection by an average of about 3,000 afy, including 4,000 afy in MZ-1. This was largely due to the imported water recharged for the DYYP. The facilities for managed recharge in MZ-1 are all located in the northwest portion of MZ-1, where persistent land subsidence has been occurring for decades and the Watermaster is currently developing a subsidence management plan. The greater volumes of managed recharge in MZ-1 can help support groundwater levels in this area and help mitigate the occurrence of land subsidence.
- The 2019-23 Actual stormwater recharge was about the same as the 2020 SYR Projection. The 2019-23 Actual stormwater recharge in the Chino Basin and the 2020 SYR Projection both averaged about 11,200 afy. Differences between actual and projected stormwater recharge are to be expected because (i) precipitation and runoff are highly variable and (ii) the projections are based on long-term expected average hydrology adjusted for climate change. Over longer time periods, Actual stormwater recharge should become approximately equal to the projections assuming stationary climate conditions. The greater-than-average stormwater recharge during the wet years of FY 2019 and FY 2023 offset the less-than-average stormwater recharge during the dry years of FY 2020 through 2022.
- The 2024 Projection for stormwater recharge is less than the 2020 SYR Projection. Due to the delays in the implementation of two recharge projects identified in the 2013 RMPU, the 2024 Projection for stormwater recharge is about 13,400 afy, about 900 afy less than the 2020 SYR Projection over the period of FY 2024 through 2030.

## CHAPTER 5 Conclusions and Recommendations

Chapter 5 documents conclusions of the cumulative evaluation of the data collected for this report and recommendations for further evaluation.

#### **5.1 CONCLUSIONS**

This section discusses the cumulative evaluation of the differences between the 2020 SYR Projection versus the 2019-23 Actual Data and the 2024 Projection. The evaluation considers the cumulative impacts on net recharge and the potential for Material Physical Injury. Table 5-1 summarizes the findings and conclusions described in prior chapters and this evaluation of cumulative impacts.

### **5.1.1 Managed Storage**

Groundwater pumping (Chapter 2) and managed recharge (Chapter 4) are components of the calculation of Managed Storage. Managed Storage can affect groundwater levels and the net recharge in the Chino Basin. For example, higher Managed Storage can result in higher groundwater levels, and hence, lower net recharge because of the groundwater/surface-water interactions in the southern Chino Basin.

Table 5-2 shows: (i) 2019-23 Actual Data for Managed Storage which was derived from Watermaster Assessment Packages and (ii) the calculation of the 2024 Projection for Managed Storage. Figure 5-1 is a time-series chart that compares the 2020 SYR Projection to the 2019-23 Actual and 2024 Projection for Managed Storage through FY 2030. Figure 5-1 shows that the 2019-23 Actual Data and the 2024 Projection is sometimes less than and sometimes greater than the 2020 SYR Projection. By the end of FY 2030, the 2024 Projection is about 14,000 af less than the 2020 SYR Projection for Managed Storage. Based on the current understanding of the relationship between Managed Storage and basin conditions, a difference of 14,000 af in Managed Storage is unlikely to have a significant effect on net recharge or groundwater levels by FY 2030.<sup>1</sup>

#### 5.1.2 Potential Deviation from Current Safe Yield

This report analyzed four potential factors that can affect the net recharge to the Chino Basin, and hence, can cause a deviation from the current 2020 Safe Yield that has been set for the period 2021-2030. These factors included: groundwater pumping, urban outdoor water use, managed recharge, and Managed Storage. The analysis indicated that actual (FY 2019-23) and projected (FY 2024-30) urban outdoor water use is substantially less than was projected in the 2020 SYR, which may materially impact the DIPAW to the saturated zone, and hence, may result in average net recharge to decline below the current Safe Yield over the Safe Yield period FY 2021-2030.

Specifically, the DIPAW to the vadose zone over FY 2019-23 was estimated to be on the order of 4,000 to 8,000 afy less than that simulated in the 2020 SYR. If this current trend continues, or if urban outdoor water use continues to decline relative to the 2020 SYR Projection, an annual difference of DIPAW to the

<sup>&</sup>lt;sup>1</sup> See Table 4-1 in the <u>2023 Storage Framework Investigation</u> (WY, 2023). Based on these results, the estimated impact of a 14,000 af difference in Managed Storage may result in net recharge increasing by less than 200 afy, or less than 0.2 percent of the Safe Yield.

#### **Chapter 5**

#### **Conclusions and Recommendations**

vadose zone of 4,000 afy or more from FY 2019-30 could result in a reduction in DIPAW to the saturated zone<sup>2</sup> of more than 3,300 afy, which is greater than 2.5 percent of the current Safe Yield (131,000 afy).

In addition, the analysis found that the 2024 Projection for stormwater recharge is about 900 afy less than the 2020 SYR Projection. Over the Safe Yield period of FY 2021 through 2030, this could result in about 600 afy less stormwater recharge than projected, which directly impacts net recharge.

### 5.1.3 Potential Material Physical Injury

The 2019-23 Actual Data and 2024 Projection for groundwater pumping indicate the potential for undesirable results related to increased risk of new land subsidence in Northwest MZ-1 that were not identified in the 2020 SYR.

#### **5.2 RECOMMENDATIONS**

As discussed in section 1, if this report concludes that (1) "there has been or will be a material change from existing and projected conditions" or (2) where there has been or will be "threatened undesirable results," Watermaster must conduct "more significant evaluation, including modeling, as described in the Reset Technical Memorandum." (2017 Court Order, p. 17.) Accordingly, the recommendations resulting from this FY 2022/23 Annual Report are as follows:

- 1. Through Watermaster's existing programs, address the potential for new undesirable results resulting from the 2024 Projection for groundwater pumping exceeding the 2020 SYR Projection. The comparison of the 2020 SYR Projection to the 2024 Projection for groundwater pumping indicated the increased risk for new land subsidence in MZ-1. To address this, we recommend that Watermaster and the parties complete and implement a subsidence management plan for MZ-1. This process is already underway as part of Watermaster's Ground-Level Monitoring Program. The continued development of a subsidence management plan should include a more precise evaluation of the potential impacts of future pumping and recharge to inform groundwater management strategies that would allow continued pumping from MZ-1 without increasing the risk of land subsidence.
- 2. Reevaluate the current Safe Yield consistent with the 2017 Court Order. This report supports the necessity to conduct additional evaluation through the 2025 Safe Yield Reevaluation (2025 SYR), due to two primary findings:
  - The results from this report have improved our understanding of the relationship between hydrologic and cultural conditions. The five years of historical data evaluated herein include two wet years of greater-than-average precipitation (FY 2019 and FY 2023) and three dry years of less-than-average precipitation (FY 2020 through 2022). As demonstrated in the FY 2019-23 Actual Data, hydrology has a measurable impact on pumping, recharge, and urban outdoor water use.
  - Based on the findings regarding the differences in urban outdoor water use and projected stormwater recharge, there is a reasonable likelihood that the cumulative impact of these differences would result in the actual Safe Yield being less than the current Safe Yield by

-

<sup>&</sup>lt;sup>2</sup> DIPAW to the saturated zone accounts for the lag time of DIPAW through the vadose zone and is one of the primary recharge components of the Chino Basin.

#### **Conclusions and Recommendations**

more than 2.5 percent, suggesting the possibility for "a material change from existing and projected conditions" (2017 Court Order, p. 17).

The current Safe Yield Reset methodology, which will be executed for the first time during the 2025 SYR, involves developing multiple projection scenarios to quantify the uncertainty in future hydrology and cultural conditions (such as the implementation of Conservation Regulations and their impact on DIPAW). This data collection and evaluation process has provided valuable insight to assist in the development of the projection scenarios. Ultimately, the projection scenarios will be evaluated with the CVM to: (i) estimate the net recharge to the Chino Basin; (ii) characterize the associated uncertainty in the net recharge estimates; and (iii) provide information to the Watermaster parties on whether it is necessary or advisable to revise the Safe Yield.

	Table 5-1. Summary of Observations and	Conclusions			
Cultural Condition (Chapter)	Main Findings	Main Conclusions			
Groundwater Pumping (2)	The 2019-23 Actual Data was greater than the 2020 SYR Projection of groundwater pumping by about 5,400 afy.	The greater pumping in the 2019-23 Actual Data is not expected t result in a significantly different net recharge compared to the 20. SYR Projection.  The differences between the 2024 Projection and the 2020 SYR Projection for groundwater pumping are not expected to result in significantly different net recharge compared to the 2020 SYR Projection.			
	The 2024 Projection for pumping is less than the 2020 SYR Projection by 1,400 afy in FY 2025 and greater than the 2020 SYR Projection by 3,900 afy in FY 2030.				
	Some of the areas where the 2024 Projection for groundwater pumping is greater than the 2020 SYR Projection overlie the Northwest MZ-1 Area of Subsidence Concern where Watermaster is currently developing a subsidence management plan.	The differences between the 2024 Projection for groundwater pumping and the 2020 SYR Projection in the Northwest MZ-1 Area Subsidence Concern indicate the potential for an increased risk of future land subsidence.			
Urban Outdoor Water Use (3)	The 2020 SYR Projection exceeds the 2019-23 Actual Data for urban outdoor water use by 21,100 afy.	The differences between the 2019-23 Actual Data and the 2020 SYI Projection suggest that DIPAW to the vadose zone may be about 4,000 to 8,000 afy less than the 2020 SYR Projection over this period			
	Based on the available information on future patterns of urban outdoor water use and the 2019-23 Actual Data, it is likely that future patterns of urban outdoor water use will be less than the 2020 SYR Projection.	The cumulative impact of these differences and likely future patter may materially impact the DIPAW to the saturated zone, potentiall resulting in average net recharge over the current decade falling below the current Safe Yield.			
Managed Recharge (4)	2019-23 Actual Data was greater than the 2020 SYR Projection for managed recharge in MZ-1 by about 4,000 afy.	The greater volumes of managed recharge in the 2019-23 Actual Data compared to the 2020 SYR Projection in MZ-1 can help suppo groundwater levels in this area and help mitigate the occurrence o land subsidence.			
	2019-23 Actual Data was about the same as the 2020 SYR Projection for stormwater recharge in the Chino Basin, averaging about 11,200 afy.	Differences in stormwater recharge between the 2019-23 Actual Data and the 2020 SYR Projection are to be expected because (i) precipitation and runoff are highly variable and (ii) the projections are based on long-term expected average hydrology adjusted for climate change. Over longer time periods, actual stormwater recharge should become approximately equal to the projections. I greater-than-average stormwater recharge during the wet years of FY 2019 and FY 2023 offset the less-than-average stormwater recharge during the dry years of FY 2020 through 2022.			
	The 2024 Projection for stormwater recharge is less than the 2020 SYR Projection by about 900 afy.	Due to the delays in the implementation of two recharge projects identified in the 2013 RMPU, the 2024 Projection for stormwater recharge is about 13,400 afy, about 900 afy less than the 2020 SYR Projection over the period of FY 2024 through 2030.			
Cumulative Impact	Based on 2019-23 Actual Data and the 2024 Projection for groundwater production and managed recharge, the 2024 Projection for Managed Storage is 14,000 af less than the 2020 SYR Projection for Managed Storage at the end of FY 2030.	The 2019-23 Actual Data and 2024 Projection for Managed Storage do not indicate the potential for net recharge to be significantly different than the current Safe Yield.			
		The cumulative impact of differences between the 2020 SYR Projection and the 2019-23 Actual Data/2024 Projection may materially impact the DIPAW and stormwater recharge to the saturated zone, potentially resulting in average net recharge ove the current decade falling below the current Safe Yield by more than 2.5 percent.  The 2024 Projection for groundwater pumping indicates the			
		potential for undesirable results related to increased risk of new land subsidence in Northwest MZ-1 that was not identified in the 2020 SYR.

<sup>(</sup>a) -- Equals projected groundwater pumping plus projected Voluntary Agreements for Pool 1 producers.

<sup>(</sup>b) -- Safe yield estimate from net recharge estimated in the 2020 SYR Report.

<sup>(</sup>c) -- Negative values mean aggregate underproduction and an increase in stored water accounts.

<sup>(</sup>d) -- 90 percent of a positive replenishment obligation is satisfied from storage and 10 percent is satisfied by wet-water recharge.

<sup>(</sup>e) -- Includes the DYYP storage account balance. Values through FY 2023 are actual values based on Watermaster's Assessment Packages.

### Appendix A

Metering and Reporting of Groundwater Pumping for FY 2023

#### **Metering and Reporting of Groundwater Pumping**

Appendix A responds to the requirement of the 2017 Court Order that Watermaster must "[e]nsure that, unless a Party to the Judgment is excluded from reporting, all production by all Parties to the Judgment is metered, reported, and reflected in Watermaster's approved Assessment Packages." (2017 Court Order, p. 16). This chapter characterizes the wells in the Chino Basin for FY 2023, including descriptions of wells that were added or went out of service in the reporting year and information on wells that are not metered.

#### Chino Basin Production Wells in FY 2023

Watermaster staff maintains a database of wells and groundwater pumping data, which is updated on a quarterly basis. Metered pumping data are collected from most Chino Basin Parties who pump more than 10 afy (a Minimal Producer as defined in the Judgment pumps less than 10 afy¹). In some cases, metered pumping data are unavailable due to lack of access to the meter, a broken meter, or for other reasons. For wells where no metered data are available, Watermaster staff applies a water duty method to estimate the quarterly pumping. The water duty method is based on such factors as: irrigated area; crop type; irrigation efficiency; livestock populations; number of domestic users; or other factors. The water duty method is currently being documented and will be included in a future report.

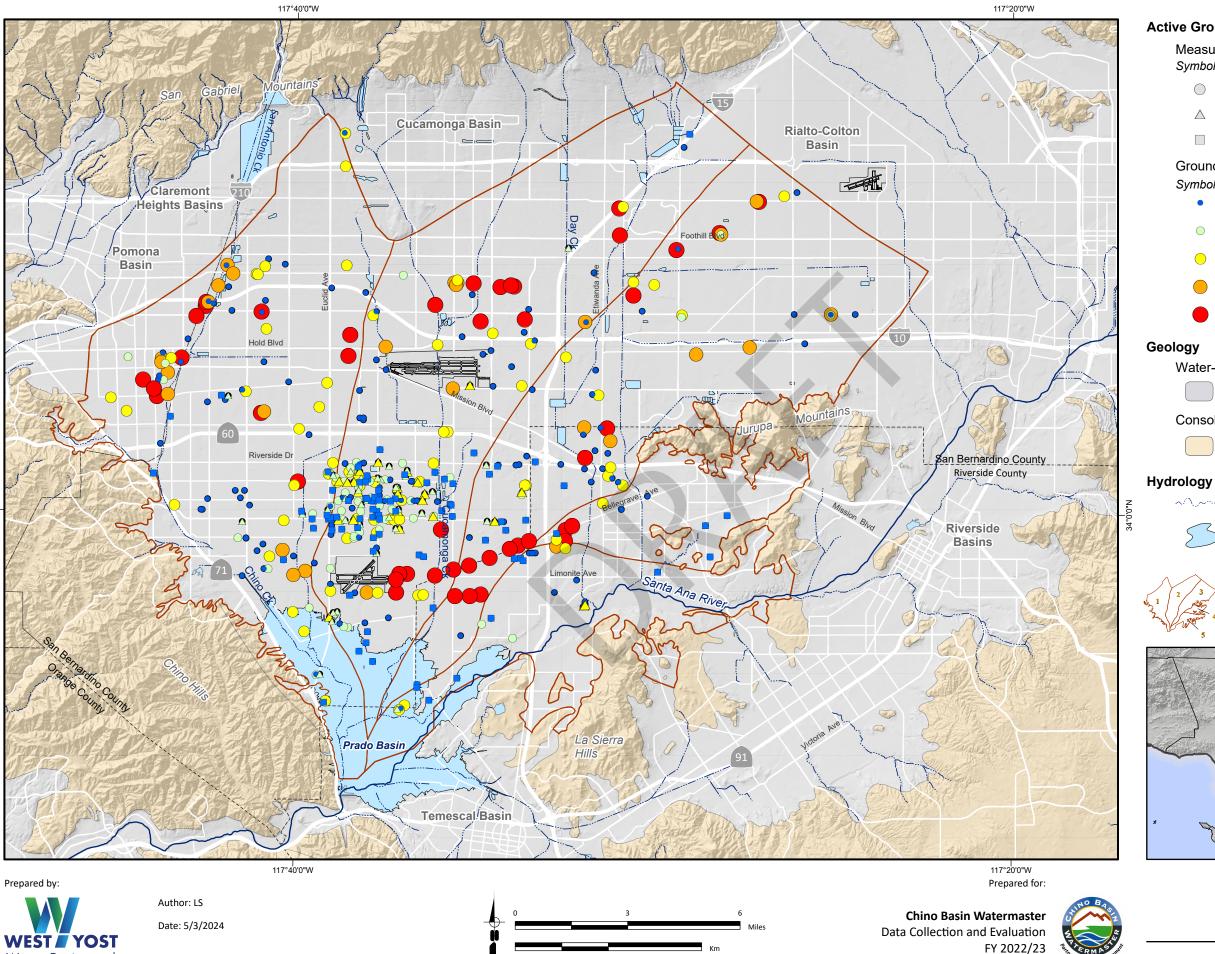

Figure A-1 shows all active pumping wells in the Chino Basin during FY 2023. These wells are symbolized by meter status, wells owned by Minimal Producers, and FY 2023 Production. There were 458 wells that were active during FY 2023, as summarized below in Table A-1.

Table A-1. Summary of Pumping Wells in the Chino Basin in FY 2023									
Well Category	Number of Wells Meeting Criteria in FY 2023	Total FY 2023 Production <sup>(a)</sup>							
Well Status									
Active for entire year	440	122,321							
Brought online in FY 2023	2	5,281							
Decommissioned in FY 2023	16	34							
Meter Status									
Metered	316	123,822							
Unmetered, Non-Minimal Producer	57	3,564							
Minimal Producer	85	250							
Total	458	127,636							

<sup>(</sup>a) Includes pumping from General Electric's wells, not accounting for injection.

Table A-2 includes a comprehensive list of the active wells in Watermaster's database for FY 2023.

<sup>(</sup>a) Well owners are current as of the end of FY 2023. A well whose owner is listed as "No Longer Ag Owner" indicates a well in a developing area where the property ownership, well ownership, and water use can change multiple times within a year. In cases where a developer, investor, or other buyer purchases agricultural land with the intent on eventually developing the land, the new owner will allow for continued use of the land, including groundwater production, until the property is developed.

## Appendix B

## **Responses to Party Comments**

#### STATE OF CALIFORNIA/WSP (RICHARD REES, PG, CHG)

#### **Comment 1**

We found the report to be well organized and effective in presenting and evaluating the annual data.

#### Response:

No response required.

#### **Comment 2**

Chapter 1 is titled "Background and Objectives." Although this section contains sufficient information that will allow the reader to infer the objectives from the text, they are not explicitly identified. We suggest that the objectives be clearly identified in this section to eliminate any uncertainty as to the report's objectives.

#### Response:

Section 1.3 was updated to address this comment. The following text was added: "The objectives of this report are to document the data collection and evaluation for the period through FY 2022/23 and document the associated peer review."

#### **Comment 3**

Section 2.1 indicates a calibration period of July 1, 1977 through June 30, 2018 for the Chino Valley Model. While this is correct for the current version of the CVM, an updated version of the CVM is being developed, has been the topic of a recent Watermaster Workshop, and has a shorter and more recent calibration period. Please add a note to the text of the Report to clarify this.

#### Response:

The text and footnote were updated to address this comment.

#### Comment 4

Table A-2 is incorrectly titled Table A-1. Please correct.

#### Response:

The table was updated to address this comment.

#### Comment 5

As suggested in our previous comment regarding Table C-2 of the Fiscal Year 2021/2022 annual report, a note has been included in Table A-2 (mistitled Table A-1) to define "Owner" and to explain wells listed as "No Longer Ag Owner." We appreciate inclusion of this note. However, it appears that some wells listed as "No Longer Ag Owner" in the Fiscal Year 2021/2022 annual report remain listed as such in this Report and, in some cases, have notable metered production (e.g., well 0600002 with 50.6 acre feet, well 0600019 with 100.5 acre feet, and well 0600026 with 119.8 acre feet). We suggest that the ownership and status of such wells be clarified if it appears that they may be continuing to be used for production.

# **Appendix B**Response to Party Comments

#### Response:

We have revised Table A-2 in response to your comment, including updating the well owners for the non-minimal producing wells listed as "No Longer Ag Owner." Watermaster has indicated that most of these wells are on lands that have been purchased by developers or other businesses that intend to develop the land. Prior to land conversion, the new landowners will allow the prior owners to use the well and land until the entity is ready to move forward with development.

#### **CUCAMONGA VALLEY WATER DISTRICT (AMANDA COKER, PE)**

#### Comment 1

Section 3.3.3 states that the cumulative impacts of differences in outdoor urban water use may result in reduced net recharge compared to the current Safe Yield, and that the differences "will likely result in less DIPAW to the vadose zone that what was simulated in the 2020 SYR." The outdoor water use analysis included in Section 3 leading to this conclusion primarily focuses on the "applied water" component of DIPAW and does not seem to take into consideration above average precipitation which may have reduced outdoor water use but resulted in the same amount of infiltration. While reduced outdoor irrigation is likely to occur in the future due to the Urban Water Use Objective state regulation, at this point the regulation is still under development and has not yet been implemented by water retailers and it is unlikely that improved irrigation efficiency is a major cause of reduced outdoor irrigation over the past several years. It would be helpful to include an analysis of additional factors which may have led to reduced outdoor water use such as increased precipitation (2019 and 2023) and the imported water restrictions and associated outdoor watering restrictions implemented by retailers in 2022. Additionally, assumptions of average irrigation efficiency equal to 80% does not reflect the current condition of landscapes within the CVWD service area, local landscape professionals estimate a much lower irrigation efficiency of about 45% for existing landscapes within the Chino Basin.

#### Response:

The scope of the data collection and evaluation is limited to evaluating the impacts of cultural conditions on the basin, which includes applied water and excludes precipitation. However, the patterns in cultural conditions should be evaluated in context of the historical hydrology. We describe the impacts of hydrologic conditions on urban outdoor water use qualitatively in the report. A more detailed, quantitative analysis of the impact of the factors that impact urban outdoor water use is beyond the scope of the analysis. The responses of outdoor water use to hydrologic conditions will be considered in the 2025 Safe Yield Reevaluation.

The historical period includes three dry years (2020 through 2022) and two wet years (2019 and 2023). While the annual differences between the actual data and the 2020 SYR Projection vary, the 2020 SYR Projection for urban outdoor water use is greater than the actual data in each of the five years. The cumulative differences indicate that less applied water is reaching the vadose zone, which may have a significant impact of net recharge.

We appreciate your input on the irrigation efficiency. Through subsequent discussions to clarify your comments, you recommended that we reach out to the Chino Basin Water Conservation District (CBWCD) to understand their work regarding irrigation surveys across the Basin. CBWCD has indicated that their property surveys show that many residential irrigation systems have an efficiency of around 40 to 50

#### Appendix B

#### **Response to Party Comments**

percent, with commercial irrigation approaching 65 to 70 percent. These irrigation efficiencies consider water losses to runoff, which are not simulated in the R4 model and are removed from the calculations of actual urban outdoor water use (see Step 5 in Section 3.2.1). Therefore, the observed differences between actual urban outdoor water use and the 2020 SYR Projection include only water consumed by vegetation and water resulting in deep infiltration to the vadose zone.

We have clarified the language regarding irrigation efficiency in the report and have revised our evaluation of impacts assuming that about 20 to 40 percent of the differences in urban outdoor water use would have resulted to DIPAW to the vadose zone. This would result in differences in DIPAW ranging from about 4,000 to 8,000 afy compared to the 2020 SYR Projection. These findings, combined with the expectation of future reductions in urban outdoor water use, may result in significant differences between the average net recharge and the current Safe Yield over the Safe Yield period FY 2021-2030.

#### Comment 2 – Urban Outdoor Water Use

Section 5.1.2 describes the potential deviation from safe yield of greater than 2.5% primarily due to a DIPAW calculation which combines the assumption of reduced outdoor applied water along with the increased irrigation efficiency to arrive at the loss of infiltration on the order of 4,000 AFY. We ask that this be reevaluated to consider the impacts of increased precipitation offsetting the reduced outdoor applied water and to reconsider the 80% irrigation efficiency factor based on appropriator feedback.

#### Response:

See response to Comment 1 above.

#### MONTE VISTA WATER DISTRICT (JUSTIN SCOTT-COE, PHD)

#### Comment 1 - Background

As quoted in Section 1.1 of the Report, Paragraph 4.4 of the 2017 Court Order establishes the Safe Yield Reset Methodology, which states in part: "The reset will rely upon long-term hydrology and will include data from 1921 to the date of the reset evaluation. The long-term hydrology will be continuously expanded to account for new data from each year, through July 2030, as it becomes available. This methodology will thereby account for short-term climatic variations, wet and dry." The "new data from each year," which is collected as part of the Annual Data Collection and Evaluation process governed by Paragraph 4.5 of the Court Order, is collected "In support of [Watermaster's] obligations to undertake the reset..." An Interim Correction to Safe Yield, as governed by Paragraph 4.3, may take place "in the event that, with the recommendation and advice of the Pools and Advisory Committee and in the exercise of prudent management discretion described in Paragraph 4.5(c), below, Watermaster recommends to the court that the Safe Yield must be changed by an amount greater (more or less) than 2.5 percent of the then-effective Safe Yield." Paragraph 4.5(c) calls for Watermaster, as part of the Annual Data Collection and Evaluation process, to "Evaluate the potential need for prudent management discretion to avoid or mitigate undesirable results including, but not limited to, subsidence, water quality degradation, and unreasonable pump lifts," and to conduct further modeling if "the evaluation of available data suggests that there has been or will be a material change from existing and projected conditions or threatened undesirable results..." In 2022, as allowed for under Paragraph 4.4, the Safe Yield Reset Methodology was supplemented to include an uncertainty analysis and to consider projected future climate conditions.

The Report makes the following Recommendations (pgs. 5-2 and 5-3):

- 1. Through Watermaster's existing programs, address the potential for new undesirable results resulting from the 2024 Projection for groundwater pumping exceeding the 2020 SYR Projection. The comparison of the 2020 SYR Projection to the 2024 Projection for groundwater pumping indicated the increased risk for new land subsidence in MZ-1. To address this, we recommend that Watermaster and the parties complete and implement a subsidence management plan for MZ-1. This process is already underway as part of Watermaster's Ground-Level Monitoring Program. The continued development of a subsidence management plan should include a more precise evaluation of the potential impacts of future pumping and recharge to inform groundwater management strategies that would allow continued pumping from MZ-1 without increasing the risk of land subsidence.
- 2. Reevaluate the current Safe Yield consistent with the 2017 Court Order. This report supports the necessity to conduct additional evaluation through the 2025 Safe Yield Reevaluation (2025 SYR), due to two primary findings:
  - The results from this report have improved our understanding of the relationship between hydrologic and cultural conditions. The five years of historical data evaluated herein include two wet years of greater-than-average precipitation (FY 2019 and FY 2023) and three dry years of less-than-average precipitation (FY 2020 through 2022). As demonstrated in the FY 2019-23 Actual Data, hydrology has a significant impact on pumping, recharge, and urban outdoor water use.
  - Based on the findings regarding the differences in urban outdoor water use and projected stormwater recharge, there is a reasonable likelihood that the cumulative impact of these differences would result in the actual Safe Yield being less than the current Safe Yield by more than 2.5 percent, suggesting the possibility for "a material change from existing and projected conditions" (2017 Court Order, p. 17).

#### **Response:**

This was provided as background and does not require a response.

# Comment 2 – Recommendations to address potential for new undesirable results resulting from the 2024 Projection for groundwater pumping exceeding the 2020 SYR Projection

Regarding Recommendation 1, please see the attached letter from MVWD to Watermaster dated April 7, 2023. In it, MVWD explains that its projected groundwater production requirements include two components: ~6,500 AFY for MVWD, and ~2,100 AFY for the City of Chino Hills. The first component is consistent with the projections included in the 2020 Safe Yield Recalculation Final Report (Table 7-1). The second component is comprised of MVWD's production of Chino Hills's production rights, at Chino Hills's request, for which they are separately assessed by Watermaster. We do not know if this production component is included in Chino Hills's historical and/or projected production in either the 2020 SYR Projection and/or in the 2024 Projection included in this Report. Please note: MVWD does not expect in the future to increase its groundwater production above historical levels. As referenced in the attached letter and other communications to Watermaster, MVWD continues to raise questions concerning Watermaster's findings regarding subsidence, including those included in this Report. At this point, we do

#### Appendix B

#### **Response to Party Comments**

not believe the threshold for "prudent management discretion to avoid or mitigate undesirable results including, but not limited to, subsidence..." has been reached for an Interim Correction to Safe Yield.

#### Response:

The demand and water supply plan projections that MVWD provided in February 2024 as part of the data collection and evaluation effort indicated that groundwater pumping is projected to increase from about 10,700 af in 2025 (including about 3,300 af to Chino Hills) to 12,400 af in 2045 (including about 3,500 af to Chino Hills). The projected transfers to Chino Hills are consistent with Chino Hills' provided water supply plan. If these water supply plan projections should be revised, please send us your revised water supply plans at your earliest convenience.

Our findings regarding subsidence in the report have been clarified as follows:

"Some of the areas where the 2024 Projection for groundwater pumping is greater than the 2020 SYR Projection overlie the Northwest MZ-1 Area of Subsidence Concern where Watermaster is currently developing a subsidence management plan. Recent aquifer compaction modeling of this area in response to the 2020 SYR Projection of groundwater pumping and recharge indicates that inelastic subsidence is expected to occur through 2050. These findings also demonstrate that the compaction is occurring primarily in the deeper aquifer layers, where some pumping occurs. The increase in managed recharge in surface spreading basins over the historical period (see Chapter 4) may have only a limited effect in mitigating subsidence.

Therefore, the differences between the 2024 Projection and the 2020 SYR Projection for groundwater pumping indicate the potential for an increased risk of future land subsidence. It should be noted that Watermaster currently conducts monitoring and management to address potential land subsidence through the implementation of the OBMP."

We do not recommend any management actions beyond the current work at this time.

# Comment 3 – Findings related to and recommendation to continue with the 2025 Safe Yield Reevaluation (2025 SYR)<sup>1</sup>

Regarding Recommendation 2, while a model evaluation of Safe Yield is already in process consistent with Paragraph 4.6, we believe the above findings may incorrectly apply the requirements under Paragraphs 4.3, 4.4, and 4.5:

#### Comment 3a

Under Paragraph 4.4, the annual data collected is to be added to the long-term hydrological data, so that the total and growing long-term dataset can "thereby account for short-term climatic variations, wet and dry." The Report's finding relies only on the most recent five years to represent such variability. Reliance here on short-term ("FY 2019-23 Actual Data") hydrology appears inconsistent with the Safe Yield Reset Methodology, which instead requires reliance "upon long-term hydrology and will include data from 1921 to the date of the reset evaluation," here through FY 2023.

#### Response:

**Page 119** 

<sup>&</sup>lt;sup>1</sup> These comments are segmented for clarity.

# **Appendix B**Response to Party Comments

Paragraph 4.4 on page 16 of the 2017 Court Order applies to the Safe Yield resets, not data collection and evaluation. The scope of the data collection and evaluation report is defined by Paragraph 4.5 on pages 16 and 17 of the 2017 Court Order, which requires the evaluation of data regarding cultural conditions for "a material change from existing and projected conditions or threatened undesirable results." The report's findings are based on evaluating data regarding cultural conditions for "existing and projected conditions" as they may impact the current Safe Yield; this confines our analysis to the beginning of the period of the most recent Safe Yield Recalculation (FY 2019) through the end of the current Safe Yield period (FY 2030). The projections developed for the 2020 Safe Yield Recalculation (2020 SYR) were based on the expected responses of cultural conditions to an average hydrology based on the long-term hydrology to which you refer. Our report considers the impacts of hydrology on cultural conditions, and this consideration informs our recommendations.

#### Comment 3b

Paragraph 4.5(c), which establishes the criteria for "prudent management discretion" for consideration of an Interim Correction under Paragraph 4.3, does not define "material change from existing and projected conditions." However, a reasonable definition would be the identification of near-term and projected conditions that are materially different to the conditions reflected in the long-term hydrology used to develop Safe Yield. A near-term delay in completion of recharge projects should not materially change projected stormwater recharge under long-term hydrologic conditions. Similarly, unless tied to a longterm change in projected conditions, the near-term reductions in outdoor use should not materially change projections of applied water infiltration based on long-term hydrologic conditions. The reductions in outdoor use reflected in the FY 2019-23 Actual Data are due to our customers' response to either emergency conservation regulations or wet-year precipitation, both of which are near-term conditions. A long-term change in projected conditions might result from our customers' response to a permanent conservation regulation, such as the one adopted by the State Water Resources Control Board last week (July 3, 2024). Obviously, we do not yet know how our agencies – let alone our customers – will respond to this non-emergency, permanent, long-term conservation regulation. However, it is clear that the answer does not lie in the FY 2019-23 Actual Data, which, again, reflects our customers' response to nearterm conditions (rainfall, or response to emergency calls to conserve). Therefore, our customers' nearterm reductions in outdoor water use, as reflected in the FY 2019-23 Actual Data, should not be considered a material change from existing and projected conditions necessitating further modeling. Instead, Watermaster should work with the Chino Basin's urban water agencies to better understand how we and our customers may respond to the State's permanent regulations that were adopted last week; a full understanding of the material change to existing and projected conditions due to this new regulation is needed, but does not yet exist.

#### Response:

As our data collection and evaluation effort focuses on cultural conditions, the analysis leads us to identify material differences in the historical ("existing") and projected cultural conditions than those used assumed in the 2020 SYR. Our conclusion on the likelihood of a significant difference in the Safe Yield compared to the current Safe Yield is based on a cumulative assessment of the "material change from existing and projected conditions," mainly driven by the differences in historical and projected urban outdoor water use.

The delay in the construction of stormwater recharge projects would not result in a material difference in existing and projected conditions in isolation.

B-6

#### **Appendix B**

#### **Response to Party Comments**

Both the "near-term" (historical) patterns in urban outdoor water use and the current understanding of the projected impacts of the Conservation Regulation on urban outdoor water use indicate a material difference in urban outdoor water use compared to what was projected in the 2020 SYR. Acute conditions can contribute to material differences if the impact is significant enough to influence the Safe Yield or threaten MPI or undesirable results.

We understand and appreciate the uncertainty in the Chino Basin agencies' responses to the Conservation Regulation. The development of this report took place as the draft Conservation Regulation was being revised; input from Chino Basin agencies indicated a high degree of uncertainty in responses and the inability to precisely project urban outdoor water use. Therefore, we did not quantify projected urban outdoor water use, but we understand from the Conservation Regulation and discussions with agencies that the future urban outdoor water use is highly likely to be less than what was projected in the 2020 SYR.

Watermaster has been working with the agencies to understand how the agencies and their customers may respond to the Conservation Regulation and will continue to do so as part of the data collection and evaluation and the 2025 Safe Yield Reevaluation (2025 SYR) efforts. Starting in the development of the FY 2021/22 report, Watermaster has requested both quantitative and qualitative information from agencies subject to the Conservation Regulation on their projected responses. During the scenario design process for the 2025 SYR, Watermaster has solicited input from the agencies on planned responses to the Conservation Regulation and has proposed multiple projection scenarios<sup>2</sup> for the 2025 SYR to simulate a range of potential responses. We continue to invite your feedback on these scenarios that will assist Watermaster in completing the Court-ordered 2025 SYR and quantifying the uncertainty of agencies' responses and their impact on the Chino Basin.

#### Comment 3c

Finally, while the Report evaluates FY 2019-23 Actual Data related to outdoor water use (applied irrigation water) and managed stormwater recharge, it neither presents nor evaluates data related to deep infiltration of precipitation outside of managed recharge (the "P" in DIPAW, or Deep Infiltration of Precipitation and Applied Water). As mentioned above, some of the reductions in outdoor use during this period are due to our customers' near-term response to wet-year precipitation (i.e., turning off their irrigation when it rains). The reason they do so is because the rainfall takes the place of the irrigation. Therefore, a full understanding of the net effect of reductions in outdoor water use during these wet years should also include the offsetting increase in precipitation.

#### Response:

As noted above, the scope of the data collection and evaluation is to collect and evaluate data regarding cultural conditions. See our response to Comment 1 from Cucamonga Valley Water District.

<sup>&</sup>lt;sup>2</sup> 6/25/2024 Draft Scenario Design TM #3

**Page 121** 

#### **CITY OF CHINO (DAVE CROSLEY, PE)**

#### **Comment 1**

Section 5.1.3 Potential Material Physical Injury. This section indicates there is potential for MPI in MZ-1 due to actual and projected groundwater pumping that may result in land subsidence. The presented data indicates within MZ-1 the actual managed recharge was approximately 20,000 acre-feet more than projected and the actual pumping was approximately 4,000 acre-feet less than projected for the period of 2019 – 2023. Actual pumping in MZ-1 during the period ranged from 36,220 acre-feet to 41,520 acre-feet. MZ-1 pumping projections for 2025 and 2030 indicate an increase of approximately 9,000 acre-feet on average (MZ-1 recharge projections are not provided). It is not clear how the provided information supports the conclusion for a potential MPI due to subsidence in MZ-1.

#### Response:

We have added additional text in Chapter 2 to clarify and support this conclusion:

"Some of the areas where the 2024 Projection for groundwater pumping is greater than the 2020 SYR Projection overlie the Northwest MZ-1 Area of Subsidence Concern where Watermaster is currently developing a subsidence management plan. Recent aquifer compaction modeling of this area in response to the 2020 SYR Projection of groundwater pumping and recharge indicates that inelastic subsidence is expected to occur through 2050. These findings also demonstrate that the compaction is occurring primarily in the deeper aquifer layers, where some pumping occurs. The increase in managed recharge in surface spreading basins over the historical period (see Chapter 4) may have only a limited effect in mitigating subsidence.

Therefore, the differences between the 2024 Projection and the 2020 SYR Projection for groundwater pumping indicate the potential for an increased risk of future land subsidence. It should be noted that Watermaster currently conducts monitoring and management to address potential land subsidence through the implementation of the OBMP."

#### **Comment 2**

General Comment. Please provide a table that breaks down by Management Zone the actual and projected pumping, outdoor urban water use, and managed groundwater recharge.

#### Response:

After subsequent discussions to clarify this comment, Watermaster will prepare exhibits that depict this information in a future report.

#### **MWD Board Funds Rialto Pipeline Rehabilitation**

On July 8, 2024, the Engineering Operations, and Technology Committee approved \$2,197,460 to rehabilitate the Rialto Pipeline, including a 35-foot section and IEUA service connection CB-11. A 12-day shutdown of Rialto Pipeline is currently planned for Feb 12-23, 2025, to complete the repairs.

New 20" Triple Offset Ball Valve

# **MWD Board Approves Future Supply Action Funding Program Agreements**

On July 9, 2024, the MWD Board of Directors approved six Future Supply Action (FSA) funding program agreements including two within the Chino Basin. The FSA program offers up to \$500k per study to member agencies with a 100% cost match. All the projects are selected by RFP, reviewed by a panel of two MWD employees and three external subject matter experts.

Inland Empire Utilities Agency, Three Valleys Municipal Water District, Western Water, and Jurupa Community Services District received \$298,500 for a pilot study on identifying and removing PFAS currently used in well drilling. IEUA also received \$401,500 for the Chino Basin Advanced Water Purification Demonstration Facility study to research advanced water treatment technologies. Other awards were given to San Diego County Water Authority for the effects of oxygenation on algal blooms, Long Beach Utilities for studying the effects of recycled water groundwater augmentation, LADWP to study the compliance of direct potable reuse technologies, and Las Virgenes Municipal Water District to validate OceanWell submerged reverse osmosis technology. Next steps include implementing funding agreements, tracking the progress of the studies, and holding a symposium to share the study results.

# State Water Project Dependent Areas Drought Mitigation Update

On June 25, 2024, the MWD Subcommittee on Pure Water Southern California and Regional Conveyance received updates about the effort to bring Diamond Valley Lake supplies to the Rialto Pipeline. This includes four projects, an Inland Feeder to Rialto Pipeline intertie (12% complete), Badlands Tunnel surge protection (9% complete), Wadsworth Pump Plant Bypass line (85% complete), and Inland Feeder to Foothill Pump Station intertie (finalizing CEQA and right of way acquisition). The Inland Feeder to Foothill Pump Station intertie is expected to be completed in 2027 while the remaining projects are scheduled to be completed in 2025.

June 26, 2024

**To:** Inland Empire Utilities Agency

From: Michael Boccadoro

Beth Olhasso

**RE:** June Report

#### Overview:

Water managers remain frustrated that they are unable to move water into storage in San Luis Reservoir because of pumping restrictions in the Delta. Lake Oroville is sitting at 97 percent capacity, 126 percent of normal; Shasta Lake is sitting at 90 percent of capacity, 114 percent of average; San Luis Reservoir is at just 52 percent of capacity; 90 percent of average.

The "Taxpayer Protection and Government Accountability Act" was pulled from the November ballot by the California Supreme Court. Governor Newsom and the Legislature challenged the constitutionality of the measure that would have made it harder to pass taxes and fees at the state and local level. The Supreme Court ruled that a constitutional amendment would be needed for such a significant change in governance.

The finish line is near for finalization of the Making Conservation a California Way of Life. The State Water Resources Control Board has released their final draft of the regulations. Oddly, the comment period for the last draft has yet to close. The Board intends to vote on the regulations July 3.

An injunction has been issued against DWR's "geotechnical investigation" of the proposed Delta Conveyance Project. State Water Contractor General Manager Jennifer Pierre called the ruling a "glaringly incorrect interpretation of the Delta Reform Act" and noted that the ruling could have significant impacts on other ecosystem restoration projects in the Delta.

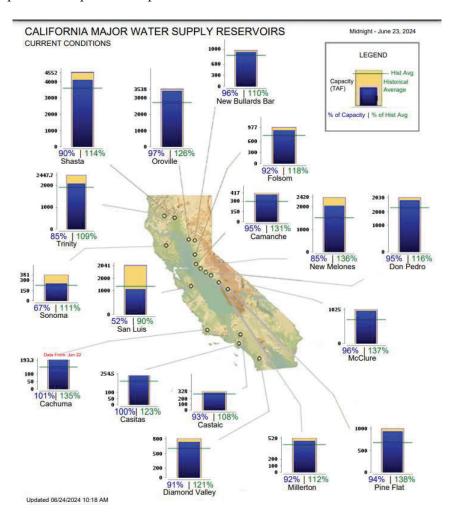

The Legislature and the Governor finally agreed on a budget package just ahead of the end of the state fiscal year. The nearly \$300 billion budget is proposed to pass June 27 and contains funding for water recycling and the Agreements to Support Healthy Rivers and Landscapes (Voluntary Agreements).

The Legislature has been working on all of the bills sent over from the opposite house ahead of the July 3 policy committee deadline. The most significant bill left for IEUA and member agencies is SB 1255 (Durazo, D- Los Angeles). The bill would create a low-income water rate assistance program that customers would have to opt-out of on their water bill. A strong Inland Empire coalition has proposed amendments to the bill and will work with ACWA and others to make major changes to the measure.

# Inland Empire Utilities Agency Status Report – June 2024

#### Water Supply Conditions

Ongoing Delta pumping restrictions continue to frustrate south of Delta water users. With abundant water in the system, and major northern storage reservoirs hovering around capacity, San Luis Reservoir remains unable to take advantage of significant water in the system to replenish stores. Lake Oroville is at 126 percent of average, 97 percent capacity; Shasta is at 114 percent average, 90 percent capacity; San Luis Reservoir is at 90 percent average, 52 percent capacity, a 10 percent drop over the pervious month.

### CA Supreme Court Removes "Taxpayer Protection and Government Accountability Act" From November Ballot

The California Supreme Court heard arguments in early May on the constitutionality of the initiative that has qualified for the November ballot. As discussed in previous reports, the initiative, filed by the CA Business Roundtable, would not only make it harder for agencies such as IEUA

to propose fees for essential services, but retroactively eliminate any fee increases adopted going back to 2022.

The Court recently opined that the proposed changes "are within the electorate's prerogative to enact, but because those changes would substantially alter our basic plan of government, the proposal cannot be enacted by initiative. It is instead governed by the procedures for revising our Constitution"—whereby proposed revisions must be submitted to voters by a supermajority of the Legislature or a constitutional convention.

#### Making Conservation a California Way of Life

The State Water Resources Control Board released their final revision of the Making Conservation a California Way of Life regulations on June 21 and plan to vote on the regulation July 3. While the regulations aren't perfect, many of the changes requested by the water community have been included in the final draft. The ACWA coalition is still pursuing changes to the adopting resolution.

#### Delta Conveyance

Recently, a Sacramento Superior Court Judge granted an injunction halting the California Department of Water Resources' (DWR) geotechnical investigations for the Delta Conveyance Project. The soil investigations allow DWR and regulatory agencies to better understand the region's geology as the design and permitting of the Delta Conveyance Project advance.

As State Water Contractor General Manager Jennifer Pierre notes, the "decision is a glaringly incorrect interpretation of the Delta Reform Act. It fails to reflect the realities of how major infrastructure projects advance and places an unrealistic and prohibitive burden on the development of any project within the Delta. Other projects providing essential services to Delta communities — like transportation or energy — could also be impacted by this ruling, as can habitat restoration and other projects aimed at restoring the environment in the Delta. Ironically, the very data gathering that has been halted today is essential for permitting agencies like the Delta Stewardship Council to make informed decisions."

#### FY 24-25 State Budget Finalized

After passing a legislative version of the budget ahead of the June 15 deadline, the Governor, the Pro Tem and the Speaker reached final agreement on the Fiscal Year 2024-25 \$297.9 billion state budget. The agreement, likely to pass on June 27, just ahead of the new fiscal year, assumes withdrawals from the Rainy Day Fund over the next two years, using \$5.1 billion in 24-25.

The agreement purports to solve a \$46.8 billion deficit through \$16 billion in reductions, the use of reserves, \$6 billion in "fund shifts," \$31.billion in "delays and pauses," and \$2.1 billion in deferrals.

The agreement includes several categories important to IEUA including:

- \$73.5 million for recycled water
- \$330 million for the Agreements to Support Healthy Rivers and Landscapes (Voluntary Agreements)

#### Legislative Update

In addition to finalizing the 2024-25 State Budget, members worked feverishly on bills that passed out of their house of origin. The deadline for bills to be out of second house policy committees is July 3. Upon adjournment on July 3, the Legislature will be in recess until August 3. They will return to Sacramento for a four-week sprint to the end of session on August 31.

Consideration of a Climate Bond is still under discussion. While the official deadline for a measure to be placed on the ballot is June 27, many believe the Legislature could still finalize a bond before the July 3 summer recess. Proposition 1 in 2014 wasn't finalized until August.

Other priority legislation for 2024 include:

**Water Use Efficiency**: SB 1110 and SB 1330 are the two bills on WUE that survived out of their first house. Both had to take amendments that narrow the effectiveness of the bills. The Legislature seems hesitant to make changes to the regulations before they are finalized by the SWRCB. This could change once the regulations are finalized later this summer.

Connection Fees: The legislature is looking to improve the state's housing crisis by changing the way connection fees are collected. The bill with the most significant concerns for IEUA was SB 1210 (Skinner, D- Berkeley). The bill, as introduced, would have prevented a connection or capacity fee from exceeding one percent of the building permit value and would spread the connection fee collection out over a period of ten years. The bill was recently amended to alleviate the concerns of the water community. The bill passed out of the Assembly Local Government Committee.

Groundwater: AB 2079 (Bennett) was amended late in the policy process and required some quick evaluation by IEUA. Mr. Bennett has historically been interested in SGMA regulated basins, however AB 2079 would put requirements on not only SGMA regulated basins, but also adjudicated basins. The bill would essentially impose a ban on new large-diameter, high capacity wells if the well would be within ¼ mile of a well used for domestic water supply or community water supply, or the well would be located within ¼ mile of an area that has subsided greater than half of a foot since January 1, 2015. IEUA coordinated a coalition of agencies in the region to secure amendments that exclude drinking water wells, monitoring wells, wells of a retail water agency and injection wells. The amendments remove the opposition of the IEUA coalition. The bill was unable to secure enough votes to pass the Senate Natural Resources and Water Committee.

#### **Low Income Water Rate Assistance**

A group of environmental justice groups have proposed legislation to create Low Income Rate Assistance programs for water and wastewater customers.

IEUA and its member agencies have been discussing the proposed legislation and WCA is participating in an ACWA workgroup to try to craft acceptable amendments. The proposed language would create a "voluntary contribution" on all water and wastewater bills that customers may opt-out of, should they choose. The proponents have expressly rejected a request to make the contribution "opt-in." Additionally, Prop 218 experts have been engaged to determine if this proposal is even legal. The bill was heard in the Environmental Safety & Toxic Materials

Committee on June 25 and will be heard in the Utilities & Energy Committee on July 1. There are a set of amendments circulating that would make creating a program for wastewater customers voluntary, clarify that the bill only applies to drinking water and several other provisions. While the amendments move in the right direction, there is still significant concern.

# Inland Empire Utilities Agency, a Municipal Water District Federal Update

June 26, 2024

#### **FY25 Appropriations Update**

In June, the House Appropriations Committee continued consideration of Fiscal Year (FY) 2025 appropriations bills. The chart below outlines the status of each of the twelve FY25 appropriations bills in the House. The House Appropriations Committee Chair Tom Cole (R-OK) is hopeful to be able to move all twelve of the FY25 bills of the floor of the House prior to the August recess.

FY25 Appropriations Bills	Subcommittee Allocation (in billions)	House Subcommittee Markup Date	House Full Committee Markup Date	House Passage
Agriculture-Rural Development	\$25.873	Passed Subcommittee on 6/11	7/10	
Commerce-Justice- Science	\$78.288	6/12	7/9	
Defense	\$833.053	Passed Subcommittee on 6/5	Passed Committee on 6/13 by a vote of 34-25	
Energy-Water Development	\$59.19	6/28	7/9	
Financial Services	\$23.608	Passed Subcommittee on 6/5	Passed Committee on 6/13 by a vote of 33-24	
Homeland Security	\$64.805	Passed Subcommittee on 6/4	Passed Committee on 6/12 by a vote of 33-26	
Interior-Environment	\$37.739	6/28	7/9	
Labor-HHS	\$186.586	6/27	7/10	

Legislative Branch	\$7.125	Passed Subcommittee on 5/23	Passed Committee on 6/13 by a vote of 33-24	
MilCon-VA	\$147.520	Passed Subcommittee on 5/21	Passed Committee on 5/23 by a vote of 34-25	Passed the House on 6/5 by a vote of 209-197
State-Foreign Ops	\$51.713	Passed Subcommittee on 6/4	Passed Committee on 6/12 by a vote of 31-26	
Transportation- Housing and Urban Development	\$90.4	6/27	7/10	

In the Senate, Appropriations Committee Chair Patty Murray (D-WA) announced that the committee will begin marking up FY25 appropriations bills during the week of July 8<sup>th</sup>.

#### Water Conservation Rebate Tax Bill Introduced in House

Representatives Jared Huffman (D-CA) and John Curtis (R-UT) reintroduced the *Water Conservation Rebate Tax Parity Act* (<u>H.R. 8682</u>). The bill would amend the federal tax code so that rebates for water conservation and water runoff management improvements are not considered taxable income. The legislation was referred to the Ways and Means Committee for consideration.

#### **House Passes WIPPES Act**

On June 11<sup>th</sup>, the House passed the *Wastewater Infrastructure Pollution Prevention and Environmental Safety (WIPPES) Act* (H.R. 2964) by a vote of 351-56. This bill would require the Federal Trade Commission to issue regulations for wipe manufacturers to label their products as non-flushable to protect against wastewater infrastructure damage. The legislation was sent to the Senate and for consideration.

#### **Federal Funding Opportunities & Announcements**

Reclamation Announces \$700 Million for Long-Term Water Conservation in the Lower Colorado River Basin. The Bureau of Reclamation (Reclamation) announced \$700 million in funding to support long-term water conservation in the Lower Colorado River Basin. Funding will support projects such as water distribution structures, advanced metering infrastructure, farm efficiency improvements, canal lining, turf removal, groundwater banking, desalination, water recycling, and water purification.

Reclamation Announces \$142.5 Million for Water Recycling and Desalination Projects. Reclamation announced \$142.5 million in funding for water recycling and

desalination projects. \$85 million was awarded for planning, design, and construction of water recycling projects while the remaining \$57.5 million was awarded to desalination projects.

**Reclamation Announces WaterSMART Cooperative Watershed Management Program Funding Webinar.** Reclamation announced a webinar to discuss the Cooperative Watershed Management Program Phase I NOFO. The **NOFO** will provide grants for collaborative, grassroots watershed groups to complete development activities, watershed restoration planning, and watershed management project design. The webinar will be held on July 2<sup>nd</sup> at 12:30 pm ET, and registration can be found **HERE**.

#### **Federal Agency Personnel & Regulatory Announcements**

**DHS** Releases Innovation, Research, and Development Strategic Plan. The Department of Homeland Security (DHS) released its <u>Innovation, Research, and Development Strategic Plan</u>. DHS will focus on climate change technologies, adaptation and resilience, equity, critical infrastructure, and emissions reductions over the next decade.

**DOE Announces Definition of Zero Emissions Building.** The Department of Energy (DOE) announced a **National Definition of a Zero Emissions Building** to promote decarbonization in the buildings sector. The definition is intended to provide guidance to developers of new and existing commercial and residential buildings to reduce emissions and energy costs.

**EPA Releases 2024-2027 Climate Adaptation Plan.** EPA released its **2024-2027 Climate Adaptation Plan** detailing how EPA will incorporate climate adaptation into programs, policies, rules, enforcement activities, and operations. The plan focuses on developing a climate-ready workforce, building facility resilience, developing climate-resilient supply chains, integrating climate resilience with external funding opportunities, use of climate data and tools, and integrating climate adaptation into the rulemaking process.

**EPA Releases Proposed Water System Restructuring Assessment Rule.** EPA issued a **proposed rule** titled "Water System Restructuring Assessment Rule." The rule would require states to evaluate water systems that repeatedly violate drinking water standards or face major financial challenges. The proposed rule would establish a new mandatory restructuring assessment authority for states and establish eligibility requirements and limitations for restructuring incentives under state-approved restructuring plans. Comments are due July 29<sup>th</sup>.

**Reclamation Announces Deputy Commissioner Appointment.** Reclamation announced Roque Sánchez will serve as Deputy Commissioner. He will oversee the internal and external relations strategies with Congress and the public regarding Reclamation's priorities, policies, and programs. He previously served as Senior Advisor

at Reclamation and a Policy Advisor in the White House Office of Domestic Climate Policy.

**Reclamation Announces New Dam Safety and Infrastructure Director.** Reclamation announced Miguel Rocha will serve as Dam Safety and Infrastructure Office Director. Rocha previously served as Chief of the Dam Safety Office at Reclamation.

Reclamation Seeks Comments on Revisions to Categorical Exclusions. Reclamation is <u>requesting comments</u> on its proposed revisions of seven categorical exclusions in the agency's implementation procedures under the National Environmental Policy Act (NEPA), covering water-related contracts, use authorizations, financial assistance, loans, and funding activities. Comments are due July 8<sup>th</sup>.

**USDA, EPA, and FDA Announce National Strategy to Reduce Food Loss.** USDA, in partnership with EPA and the Food and Drug Administration (FDA) announced the **National Strategy for Reducing Food Loss and Waste and Recycling Organics**. The strategy provides guidance to government agencies, retailers, and consumers on working together to prevent the loss and waste of food, increase recycling of food and other organic materials, reduce greenhouse gas emissions, and decrease food costs for consumers.

AB 1827	Papan (D)	Local government: fees and charges: water: higher- consumptive water parcels.	Inis bill would provide that the tees or charges for property-related water service imposed or increased, as specified, may include the incrementally higher costs of water service due to specified factors, including the higher water usage demand of parcels. The bill would provide that the costs associated with higher water usage demands, the maximum potential water use, or a projected peak water usage demand, the maximum potential water usage demand may be allocated using any method that reasonably assesses the water service provider's cost of serving those parcels that are increasing potential water usage demand, maximum potential water use, or project peak water use demand. The bill would declare that these provisions are declaratory of existing law. This bill contains other existing laws.	Senate Appropriations Committee	IK WD Sponsor ACWA, SCWC Support
Page 138	Wilson (D)	Local government: property-related water and sewer fees and assessments: remedies.	This bill would prohibit, if a local agency complies with specified procedures, a person or entity from bringing a judicial action or proceeding alleging noncompliance with the constitutional provisions for any new, increased, or extended fee or assessment, as defined, unless that person or entity has timely submitted to the local agency a written objection to that fee or assessment that specifies the grounds for alleging noncompliance, as specified. This bill would provide that local agency responses to the timely submitted written objections shall go to the weight of the evidence supporting the agency's compliance with the substantive limitations on fees and assessments imposed by the constitutional provisions. The bill would also prohibit an independent cause of action as to the adequacy of the local agency's responses. This bill contains other related provisions and other existing laws.	Seante Local Gov 7/3	ACWA Sponsored bill
AB 2515	Papan (D)	Menstrual products: perfluoroalkyl and polyfluoroalkyl substances (PFAS)	This bill would similarly prohibit any person from selling in the state any menstrual products that contain regulated PFAS, as defined. The bill would require, no later than January 1, 2027, the Department of Toxic Substances Control (DTSC), in consultation with the State Department of Public Health, to identify and assess the hazards of chemicals or chemical classes that can provide the same or similar function in menstrual products as regulated PFAS and that can impact vulnerable populations and to make this information publicly available on the DTSC's internet website. The bill would authorize the department to adopt regulations, as specified, for the purposes of implementing and enforcing these provisions. The bill would make a violation of these provisions punishable by civil fines, as specified, and would make any fine or order by the department appealable to the Board of Environmental Safety. The bill would create, and would require all fines collected by the department to be deposited in, the T.A.M.P.O.N. Act Fund. The bill would also authorize any person to bring an action in superior court for a violation of this prohibition, and would authorize the court to grant injunctive relief. This bill contains other existing laws.	Sen. Judiciary 7/2

Existing law prohibits a local agency that imposes fees or charges on a residential development for the construction of public improvements or facilities from requiring the payment of those fees or charges until the date of the final inspection or the date the certificate of occupancy is issued, whichever occurs first, except that the payment may be required sooner if the local agency determines that the fees or charges will be collected for public improvements or facilities for which an account has been established and funds appropriated and for which the local agency has adopted a proposed construction schedule or plan prior to final inspection or issuance of the certificate of occupancy, or if the fees or charges are to reimburse the local agency for expenditures previously made. This bill would delete the above-described authorization for a local agency to require payment of fees or charges prior to the date of final inspection or issuance of the certificate of occupancy, whichever occurs first.	This bill would declare that it is the policy of the state to ensure no net loss and long-term gain in the quantity, quality, and permanence of wetlands acreage and values in California. The bill would make related legislative findings and declarations.	This bill would instead provide that the date the board is authorized to issue a written notice to January 1, 2026 and a conservation order to January 1, 2027.	This bill would require the board to additionally consider lower cost actions the water supplier has implemented or will implement in order to help the water supplier achieve overall water supply resiliency in determining whether to issue an informational order. This bill contains other related provisions and other existing laws.	This bill would require, among other things, the Office of Environmental Health Hazard Assessment (OEHHA) to study the health impacts of microplastics in drinking water, including bottled water, in order to evaluate and identify safe and unsafe levels of microplastics in those types of water, and, on or before January 1, 2026, to develop and deliver to the state board, among other things, public health standards and goals for a safe level of microplastics in those waters. The bill would require the state board, on or before January 1, 2028, to adopt and implement those public health standards and goals developed and delivered by OEHHA, and to provide those public health standards and goals to local water agencies, along with other specified information provided by OEHHA. The bill would also require the state board to establish testing and reporting requirements for an annual testing of microplastics in bottled water sold in or into this state, as specified.
